Midland, Ont., August 16th, 1917.
 The Corbet Foundry and Machine Co., Limited,
 Owen Sound, Ont.

Dear Sirs,—

We are pleased to be able to report to you that your No. 2 Automatic Steam Towing Machine, which has 1200 ft. of 1-inch dia. Steel Hawser, which you installed on our tug D.S. Pratt, is giving us first-class satisfaction. We have been using this machine two years and there is no doubt but that it is far ahead of the old manilla rope, both in cost and trouble of handling. We take pleasure in recommending same.

Yours truly,
 Canadian Dredging Co., Limited,

Now that Labor Costs Are High

Shop Superintendents should see to it that men don't waste time and labor with inefficient tools.

For instance, it's much cheaper to give a mechanic a new file than to have him waste time working with a file that has passed its "efficient point."

Also it pays to buy standard quality tools. You get the best results for the longest time.

All good mechanics recognize "Famous Five" as the standard quality files.

Specify them when ordering.

Ring Oiling

WHY

Bond Hangers

Eliminate
Hot Bearings

Are you considering the purchase of Hangers for your new factory?

Perhaps you do not realize the necessity of buying hangers that will eliminate hot bearings, or the trouble they will cause in a hanger? If a bearing happened to become hot in a hanger holding six or more machines, and they all stand idle while the shop mechanic fools around trying to fix it, you'd soon realize what inefficiency and expense this is.

The Ring-oiling device on Bond Hangers supplies a constant flow of lubricant on the full surface of the shaft and bearings, which keeps them cool when running at high speed.

Get our catalog containing full details before you buy.

More Draft— Better Combustion

Many Timber Mill Engineers are not getting anywhere near the power they would like, from their boilers.

WHY?

Well, in nearly every case it is because the fuel used is waste and nearly always wet, and it does not give enough heat.

THE SUREST AND THE QUICKEST WAY to get more heat when burning moist waste fuel is to FIT IN A COPPUS BLOWER.

Fit in a "COPPUS" BLOWER

The results will more than surprise you, although there is nothing surprising about the method—it is merely a modern invention, based on the principle of the old-time blacksmith's bellows.

The "COPPUS" consists of a propeller fan driven by a steam turbine, both mounted on the same shaft. The fan, operated by the turbine, revolves at a great speed, forcing the air through the fan casing and causing a tremendous draft under your boiler fire. It is simple, but it is reliable.

It takes only about one per cent. of the steam from your boiler to drive the Coppus Blower, but it means that you get the full power of the boiler capacity. Don't go to the expense of bigger boilers for more power. Make your present equipment do the work. It will do it—yu'll see if you attach this efficient blower equipment.

As an Engineer, our booklet describing this blower is bound to interest you.

The REILLY

MULTI- COIL

FEED- WATER HEATER

We Ask Your Opinion

Mr. Successful Manager, what is the part of a power plant equipment that will pay for itself quickest if it does its work right. We think you will agree that it is the feed water heater. The best of its kind is the REILLY MULTICOIL FEED WATER HEATER.

Immediately fitted, it starts earning money by saving a large percentage of fuel and improving the condition of the boilers.

Turn exhaust steam into dollars. It is cheaper to heat water with a Reilly Feed Water Heater than with fuel in the boilers. The hotter the feed water the longer the life of your boilers. Send details of requirements and we'll send complete information and prices.

We sell Ashton Gauges, Mason Reducing Valves and carry a complete stock of high-class power plant equipment.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

No. 7

Why Proposed Housing Plan is Not Feasible

The men who have seen visions and dreamed dreams have pioneered the world to better and brighter things. Achievements which have not been first pictured in the mind would never be accomplished. Any cherished ideal would never be converted into concrete form, unless the original promoter had thought long and seriously of the great end in view and visualized it in every detail.

All of which leads up to a consideration of the proposition which was presented in recent issues of the "Canada Lumberman," by Mr. Alfred Fitzpatrick, superintendent of the Reading Camp Association, on the erection of a quadrangle of cottages heated by means of a central steam plant. Mr. Fitzpatrick even went further in his conception of the ideal, and presented a picture of life in woods operation with a married man occupying his own little home and living in peace and happiness surrounded by his wife and bairns. In connection with the lot of the single men, it was portrayed that they could have hot and cold water at their disposal night and day, shower baths and dry houses, as well as a laundry, a bakery, electric lights and other facilities provided in the older and denser centres of population.

In the interviews obtained with representative firms, who have carried on extensive woods projects in various parts of the Dominion there has been no disposition evidenced other than to treat Mr. Fitzpatrick's suggestions with the utmost courtesy and fairness. Practically all the operators agree that while the ideas are inspiring and comprehensive they are not feasible so far as present-day conditions are concerned. The principal reason which makes impossible the carrying out of Mr. Fitzpatrick's plan in the matter of improving the housing of the Canadian lumberjack, is that in the first place it involves too large an expense. No firm could stand the outlay in the present period of keen competition and constantly mounting operating costs. The wages of lumberjacks have ascended fully 100 per cent. since the war began, and the expense of feeding them has advanced in

like fold. Labor has been exceptionally difficult to secure, is restless and independent in attitude and, owing to the large number of green hands employed, is only from 50 to 75 per cent. efficient. It is the experience of the lumber trade that while prices have advanced considerably, the figure realized for the finished product is not at all commensurate with the augmented expenditure.

The condition of the lumberjack today, considering the frequent shifting of woods operations and the gradual recession of the sources of supply from the base of civilization, is a comparatively happy one. The provincial regulations stipulate that all camps must be clean and sanitary and a certain amount of air and space allotted to each man. If camps were of a permanent character and woods operations could be carried on at or near the same spot for several years, there is no progressive concern but would give serious consideration to the proposition of Mr. Fitzpatrick, for lumbermen as a class are a large and liberal minded body of men. They do things on a great broad scale and there is nothing small in their conceptions or ideals. The very life which they lead out in the open fills them with lofty thoughts and kindly impulses. Even this communication with Mother Nature is not sufficiently responsive to give ready acquiescence to the ideals of Mr. Fitzpatrick.

There are other reasons why the cottage system could not be carried out, but the principal objection is that present-day conditions preclude the possibility of the erection of cottages such as is proposed owing to the temporary character of woods operations. Another obstacle is that such an investment could not be made in these days with the high cost of labor and materials, as within a very short period the undertaking would be rendered practically useless owing to the timber supply giving out and the necessity of moving the camp to other quarters. It might be well for Mr. Fitzpatrick to present some definite, detailed plans and specifications regarding the cost of erecting and equipping such a camp and ascertain how his figures tally with those of several practical men who have estimated that to build cottages steam heated and fitted with all the modern accessories suggested, would entail a disbursement of \$30,000, and even then not more than one hundred men would be accommodated. Until these figures are disproved, little that is practical can be done in the way of furthering the proposition of the superintendent of the Reading Camp Association, which, while ambitious and perhaps somewhat Utopian, has, at least, aroused much interest and timely discussion.

Can Present Employment Methods be Altered?

Some criticism has been heard during the past winter of the practice of engaging men for the lumber camps through the medium of employment agencies or bureaus, and also for paying railway fares. It has been stated that such a system tends to the disorganization of labor generally and is pampering the lumberjack to an extent where he is almost as independent as a plumber when the temperature is twenty below zero and freezing waterpipes galore. It has been further urged that the lumberjack by such a system loses his individuality and becomes a sort of pawn or chattel, to be moved about at the will of the agency or the lumber companies employing this means of getting assistance.

There is no doubt that there are some unscrupulous and designing bureaus which induce men to go to certain centres and jump camp—or take French leave, as it is sometimes called—in order that the agencies may collect the regular fees per capita for securing employment. On the whole, however, while there may be some very black sheep in the flock, the employment agency, if properly regulated, is no doubt the best and quickest means through which lumber companies can secure help. In the present dearth of woodsmen, it is impossible to discriminate in the character of the labor that is available. Any and all kinds have to be taken and even then many camps have been woefully undermanned during the past winter, so that the cut in some of them will not reach more than fifty or sixty per cent. of normal. This has been brought about through the high cost of maintenance and, as stated, through lack of help, both skilled

and unskilled. It has been almost impossible to get men of any kind at some centres.

A well-known nautical proverb is "any port in a storm," so the woods operators have had to face conditions as they are and corral whatever labor was possible. Naturally, a large proportion of the lumberjacks are of foreign descent and were it not for the labor bureaus many would not know where to apply for work. They would not take the time or the trouble to hunt out individual companies, and the employment bureau affords a sort of a rallying point for them. In fact, not a few lumber concerns find it necessary to engage not only an employment agent, but also to make the fullest use of the bureaus. These agencies are, of course, not ideal, and their methods are often open to question, but under the present system they perhaps meet conditions as well as can be expected when so many expert axemen and bushmen are doing service overseas.

In regard to the payment of railway fares, this system is acknowledgedly bad and many companies suffer heavy losses through men jumping their jobs after only a few days or weeks' work. As the ordinary lumberjack is generally out of funds at the commencement of each season there would be no possible way of getting the men to work if railway fares were not advanced. It has been pointed out that the fellows who go to the camps on their own responsibility are without doubt more desirable than those who come through employment agencies, but as one firm pertinently observes, "if an employer put up an ideal camp and waited for men to come to it he might find that when spring arrives the camp was still beautiful to look upon, but that there had been no output of logs." Any methods that are honorable and efficient and will result in getting out the logs are being employed at the present juncture when the members of the lumber trade—like those in every line—are facing an upheaval of conditions such as they have never been called upon to encounter in the past, and may never be called upon to meet again.

Shingle is Still Best Roof Covering

Organized effort and well directed publicity backed by quality goods and efficient service will create expansion in any industrial enterprise. A splendid evidence of this is indicated by the annual showing of the British Columbia manufacturers of red cedar shingles. The past year has been a phenomenally successful one with this association, and the value of the output was nearly \$8,000,000. The shingles found not only an excellent market in the United States, but also in Canada. One leading factor in contributing to the remarkable development has been co-operation, and another outstanding feature has been wisely controlled and constantly maintained publicity.

Ever since the shingle men on the Coast decided to enter upon an advertising propaganda the results have been most gratifying and the merits of the red cedar shingle are known today in many quarters where a decade ago this roofing material had never been referred to. Notwithstanding that manufacturers of patent products have been busy in season and out, spending large sums of money to popularize their products, the time honored shingle still maintains its prestige and predominance. Advertising has helped to keep it in active demand, and to correct many misleading reports that have been spread about it by dealers in other lines of roofing.

The production of 10,000 carloads of shingles in the Pacific Coast province during 1917 affords some conception of the magnitude of the industry. It is interesting to note that wood shingles make the cheapest roof protection both from the point of view of dollars and length of service. This statement is made by H. R. Isherwood, Retailers' Expert of the National Lumber Manufacturers' Association, who has prepared a comparative cost table of shingle, slate, asphalt, asbestos and asphalt roofs. The table was prepared after several months of careful investigation, and is based on Middle West retail prices, but the lesson it teaches is true in every part.

Mr. Isherwood says: Taking a roof 10 feet square as a working base, I figured out the exact cost of covering such a roof with each of the materials previously mentioned, the total including the cost of all materials including even the nails and the cost of labor.

Among the facts brought out by this compilation are these: That

a roof of the highest grade wood shingles, which has a life of thirty years, costs \$10.54 or \$8.66 less than an asbestos roof of the same life; \$9.11 less than a slate roof of the same life; \$4.81 less than an asphalt shingle roof of only 20 years life, and only \$1.11 more than asphalt roll roofing which is estimated to last only ten years—that roofing covered with wood shingles of 20 years life costs \$5.61 less per 100 square feet than a roof covered with asphalt shingles of the same life; that wood shingle roofs cost little more than half as much as either asbestos or slate roofing; that the wood shingle roof weighs 376 pounds less per 100 square feet than the asbestos shingle roof, 605 pounds less per 100 square feet than the slate roofing, and 148 pounds less per 100 square feet than the asphalt roofing. And the weight of a roof is very often the determining factor in the choice of materials.

Stimulating Spirit of Doing Some Building

With the advent of spring the thoughts of the average real estate possessor are not only being directed by advertisements, both on the highways and in the press, to the necessity of a greater production, but many evidences are abroad that building—particularly in the rural communities—will be conducted on a larger scale than at first anticipated. There is something in the breath of the vernal season which makes a man who lives out in the open want to put up a new implement shed, garage, drive house, hennery or piggery, and by the way the prices for the porcine product are soaring, it would not take many animals to pay for a large, well equipped and thoroughly sanitary pigsty—all of which brings grist to the local lumberman.

There are many points such as these which the retail lumberman can present for the instruction of the residents in his locality and thus set their minds in motion along the line of erecting new edifices. We are all creatures, subject to suggestion, and influenced whether we care to admit it or not, by the pursuits and pastimes of our neighbors. If one alert and public spirited resident starts putting up some new building in a certain district, others are sure to follow. The contagion is insistent, and one might almost say imperceptible, but it is there all the same. No one can tell whether the present year will be a big building one or not, but the really far-seeing supplier of materials will do everything in his power to make the amount large. Education and inspiration, in well printed and nicely illustrated booklets, folders, and newspaper announcements do much to stimulate trade for the lumbermen. He should point the way to higher and better things and his advertising and selling talks should be bright and cheerful. They should show that he has faith in the coming season himself and being possessed of this desirable quality, he will fill others with the same spirit. He should impress upon the public the advantages that it will be to them to purchase material now for any new project that they have in mind and that his particular yard is the place where the needs of all, whether the requirements are great or small, can be met.

There is a happy faculty of getting the public interested in one's announcements by making each advertising talk of such seasonable, yet personal interest, that the reader feels it is a special communication to him and to no one else. Recently a certain member of the trade committed a rather serious indiscretion by jumping to the conclusion that, as building activities had been less during the last year than in previous ones, that the coming season would of necessity still show more diminution in the structural line. He therefore issued a booklet in which he emphasized the necessity of going to his particular place for "Repairs of All Kinds." This is a bad impression to create. If one desires to encourage the erection of new buildings and to put energy in that direction the word "repairs" should be mentioned as little as possible during the spring months. It is to the larger affairs that the retail lumberman should devote his publicity propaganda. Like the poor, repairs and alterations will always be with us, and a certain amount of work in this line has to be carried on whether times are good or bad, war or no war, but to encourage the erection of new buildings is a constructive and laudable undertaking.

Built Large Sawmill in Just Nine Days

Expert Work Done by Canadians in France under Direction of Major Hartt—How Construction was Carried on and Everyone Joined in

Major J. I. Hartt, Orillia, Ont.

With three train loads of plant, materials, horses and men, a map showing the topography of the country and a company of 175 men—all Canadians—Major J. I. Hartt, M.P.P. for East Simcoe, who recently spent a couple of months' furlough in Canada, landed in France early last summer. The necessary sawing equipment for a mill was taken along, including boilers, engines and dynamos, all being supplied by Canadian firms.

The specifications of the timber that was to be taken out of the bush were received from headquarters, and exactly nine days after landing in France, Major Hartt and his men had built and equipped a sawmill of 35,000 feet daily capacity and had same in operation delivering ties to the allied troops. The despatch with

which the plant was erected in the Gironde district in the south of France was the wonder of the rural people. They were amazed at the industry and aggressiveness of the Canadians.

"All my men were from the Dominion," declared Major Hartt, to the "Canada Lumberman," "a great number were handy with the axe, the saw, the team, electric motors—in fact every trade. Not one of them was afraid of hard work, and they all went at the task in hand with a spirit and optimism that was contagious. As I have said, just nine days after we landed in France everything was completed and the mill machinery running in first class shape. The mill was lighted by electricity and a narrow gauge railway had been built from the woods up through the plant. On this the logs were brought

proud of the way in which the Canadians conducted affairs. I heard of one German sawmill that had been shelled and captured, then some members of the Canadian Forestry Corps took possession and operated the plant. A considerable amount of timber belonging to the enemy was cut and used by the Canadians for trench work and road building.

"The timber sawn in the Gironde district was principally white pine. It is larger than that generally cut in Canada. The majority

The mill that was completed in nine days, showing part of day's cut awaiting shipment to the trenches.

of it went into railway construction and the remainder into huts, plank roads and general trench work."

Major Hartt states that one mill turned out from the middle of September to the middle of January about 5,000,000 feet of material. The timber in the Gironde district was planted many years ago, Napoleon having started it in order to check the encroaches of the sand from the sea.

Major Hartt, who recently returned overseas after spending a few weeks at home, was an exceptionally busy man during his stay. He not only attended to his legislative duties in Toronto, but introduced a bill in the House in the interests of daylight saving. He was also elected Grand Master of the Grand Orange Lodge of Ontario West at the recent annual session. Major Hartt is a widely known lumberman, having had 35 years practical insight into all branches of the industry. For thirteen years he was with the Gilmour Company, when they conducted a flourishing mill at Trenton, and filled practically every position in the service. He was then with the Fesserton Timber Company for several years, after which he formed the firm of Hartt and Steele and subsequent to the dissolution of the partnership carried on business for himself. Major Hartt, whose home town is Orillia, was most enthusiastic in the interests of recruiting, and as soon as an opportunity presented itself went overseas.

Good Salesmanship Gets the Price

A lumber salesman called on a certain lumber dealer who had long been a regular customer. The dealer enquired the price of certain stock and was told that it was \$46.50. The dealer said: "Why, I am selling that stock at \$45!"

"Well," said the salesman, "that is where you make a mistake. You can just as easily get \$60 if you ask for it. Try it on the next farmer who comes in for lumber. If he kicks, call his attention to the fact that he is getting two and three times as much for the stuff he raises as he used to."

While they were talking a farmer came in and asked the price of the same lumber they had been discussing. The dealer's son was waiting on the customer. "That stock is worth \$60," he said.

"Isn't that pretty high?" asked the farmer.

"Yes, it is high," replied the young salesman, "but so is everything else. You are getting \$1.50 to-day for your corn and you used to sell it for 50 cents. Don't you remember?"

"Guess that's right," replied the farmer. "Well, I suppose I can afford to pay your price, as the increase in lumber isn't nearly as much as the increase in corn."

He got his lumber and went away satisfied.

The rapid construction of a saw mill in southern part of France by Canadians under command of Major Hartt.

in and sawed into whatever timber was required, and once more the output went on its journey by a standard gauge route to the main line. Even the railways of which I speak were built within the nine days. Timber cut as late as four o'clock on the afternoon of the first day was sawn into ties and shipped out that evening. Despatch was the main thing. A thousand feet of timber in hand is worth more than a million you can't get, and everyone recognized this.

Proud of Agility of the Canadians

"Yes," he continued, "we had a few technical men, of course, such as sawyers, edgers, and millwrights, but the great bulk of the work was done by the versatile and hustling Canadians. The mill ran night and day and later another was erected in the same district. I am

Make Owner Liable for All Just Debts

The Defects in Mechanics Lien Act Pointed Out by Representative Firms Who Specify Where Adequate Protection is Not Afforded

During the recent session of the Ontario Legislature there were some amendments to the Mechanics Lien Act, but the changes which have been made are not sufficient to cover all the points which the retail lumberman would like to have included.

There are many provisions to correct, and it is intimated that, at the next session of the legislature, a new bill will be submitted practically wiping out all the clauses of the present measure. It is confidently hoped that the new act will be based along the lines of the Ohio and Wisconsin state measures. An outline of the former appeared in the "Canada Lumberman" a few weeks ago, and in this issue a synopsis of the latter is presented.

D. S. Montgomery, of Milwaukee, secretary of the Wisconsin Retail Lumbermen's Association, in a letter to the "Canada Lumberman," says: "We are pleased to enclose a copy of the Wisconsin lien law and also a synopsis of same by our association attorney and a copy of the 'thirty-day notice,' all of which we hope will be of assistance to you in the important matter of securing the enactment of a good lien law. We would say that the law operates in a very satisfactory manner, with one exception, and that is that a lien filed by a building and loan association takes precedence over all other liens, no matter when it is filed, as long as it is filed within the time limit. This puts the building and loan association lien in a very preferred class, doing an injustice to the retail lumberman. We are working on this question, in co-operation with the building and loan associations, and are hoping to have this point adjusted in a manner equitable to all concerned."

Wisconsin Lien Law

Lumber dealer the principal contractor—i.e., where you furnish material directly to the owner—you are required to serve no notice whatsoever, but must simply file lien within six months of the last delivery and date of last charge. Such lien may be renewed for a year, as heretofore.

Lumber dealer the sub-contractor—i.e., where you furnish material to the owner through a contractor—you are required to serve **one notice only**, namely, **within 30 days after furnishing the first material** you must give notice in writing to the owner or his agent, stating that you have been employed to furnish, and are now furnishing, material, and describing the real estate upon which the material is furnished with reasonable accuracy, so that the owner will not be misled or deceived thereby. **Note that a verbal notice will not suffice. The notice must be in writing.**

If the account remains unpaid and you wish to file lien, such **lien must be filed within 60 days after the date of the furnishing of the last material.** Copy of the said 30-day notice must be filed with your claim for lien. Such lien may be renewed for a year, as heretofore.

The notice to the owner within 30 days of first delivery is compulsory, if you wish to preserve your lien rights. If you fail to serve such notice, you thereby totally forfeit your right to file lien whatsoever. Likewise, in order to perfect your lien, you must file the claim for lien in the office of the clerk of the circuit court within 60 days after last delivery of materials.

The Wording of the 30-Day Notice

It need not be any special form, but may be written on your business letterhead. It need state only that you have been employed to furnish materials upon certain real estate, which you may describe by lot and block, or in any other reasonably accurate manner. (A suggested form of such notice, for execution on your own letterhead, is handed you herewith on separate enclosure.)

If you serve the written notice personally, do so in the presence of witness; retain copy of notice and record thereon the date and hour of service and name of witness. If you serve the written notice by mail, send it registered, and see that you get a registry return receipt.

A sub-contractor is required to file his lien within 60 days and a principal contractor within 6 months after delivery of last materials. The sub-contractor must serve the 30-day notice on the owner in every case to preserve his lien.

Suggested Form for 30-Day Lien Notice

Dear Sir: 191...

As owner, or as agent of the owner, you will please take notice that we have been employed by John Jones to furnish materials for the building improvements being made on the property located at or

near No. 950 Grand Avenue, in the Fourth Ward of the City of Milwaukee, Wisconsin.

Vary truly yours,

The above notice, as you know, may be written on your regular letterhead, and it is proper to retain a carbon copy. Such carbon copy should be signed by the writer of the letter in ink, just the same as the original. Furthermore, you should write with ink on the said carbon the important particulars regarding when and where you mailed the notice. For instance, something about as follows: "Mailed in mail box southwest corner East Water and Wisconsin Streets, July 10, 1917." Such procedure will enable you to use such carbon copy in court, if necessary, for on the basis of it you can swear positively that the notice was mailed to the address as shown. A carbon copy is not a valid document in court unless it is signed by the writer of the original. While the notice may be sent as an ordinary letter under 2-cent postage, the better plan will always be to send it registered mail, demanding a registry return receipt, so that you will have some proof in writing that the notice was received by the owner or his agent.

Contractor Must Satisfy All Claims

Four of the principal clauses in the Wisconsin act read:

All moneys paid by the owner to the principal contractor shall be and constitute a trust fund in the hands of such principal contractor, to the amount of all claims due from or owing by such principal contractor for work, labor, and materials, or to become due from or owing by such principal contractor for such work, labor, and materials to persons entitled to a lien under this chapter against said owner and his property until all such claims have been paid; the using of such moneys by such principal contractor for any purpose other than the payment of such claims, until all such claims, except those which may be in dispute, have been paid, is hereby declared to be an embezzlement of said moneys, punishable as provided by law in case of embezzlement.

In all cases where a lien shall be filed under the provisions of this chapter by any person other than the principal contractor, it shall be the duty of such principal contractor to defend any action brought thereupon at his own expense, and during the pendency of such action the owner may withhold from the contractor the amount of money for which such lien shall be filed and an amount sufficient to defray the costs and expenses of such action; and in case of judgment against the owner or his property upon the lien he may deduct from any amount due by him to the contractor the amount of such judgment, and if he shall have settled with the contractor in full, may recover from him any amount so paid for which the contractor was originally liable.

And any contractor or any person furnishing materials under him who shall purchase materials on credit and represent at the time of making the purchase that the same are to be used in a designated building or other improvement and shall thereafter use or cause to be used the said material in the construction of any building or improvement other than that designated, without the written consent of the person from whom the materials were purchased, shall be punished by imprisonment in the county jail for not more than three months or by a fine not exceeding three hundred dollars.

The provisions of this section shall also apply to all cases where improvements are being placed upon real estate by any person holding such land under any contract of lease, demise, or contract for the purchase or sale thereof, but in that case the lien shall attach only to the interest of such person in said real estate unless the owner of such property shall authorize or approve of the same.

How the Ontario Act Is Viewed

That the Mechanics Lien Act in Ontario needs thorough revision and that the owner of the building should be held responsible for the settlement of all bills for work, labor, and material is the consensus of opinion of retail lumber dealers in all parts of the province.

The present law provides that the owner shall pay to the contractor, as the building progresses, 80 per cent. of the amount certified to by the architect as having been earned, retaining only 20 per cent. to satisfy the claims for materials and labor which remain unpaid.

This is one feature of the measure to which decided objection is taken. The views of some representative firms are set forth clearly and cogently on this particular point in the subjoined letters:

The Ludlam-Ainslie Lumber Company, of Leamington, Ont., say:

"We have been led to consider this act as pretty much of a farce when viewed from the standpoint of the supply man. The 20 per cent. clause is about sufficient to protect labor, which has a preferred claim, but it is practically of no value in securing to the supply man the price of his goods. It may serve as a kind of bluff, but when you come to fight out the matter in the courts you may as well throw up your hands before you begin. At least, such has been our experience, and we believe the experience of a great many others.

"It frequently happens, too, that contracts are awarded to men of little or no means, but who are particularly sensitive in the matter of their credit. The supply man, therefore, has the choice of offending his customer by filing a lien at the beginning of his contract or of letting his right of lien go. In the former case he usually loses his customer, but the losses in the latter case are equally discouraging.

"We think this could be remedied by the proprietor being made responsible for the distribution of the money involved in the contract.

Is Anything But Satisfactory

Thomas Patterson, of the Patterson-Tilley Company, Hamilton, writes: "From our standpoint, the act is anything but satisfactory. We have had a number of experiences where contracts have been undertaken at a price much below what they could be done for, and in many of these cases the decided difference between the accepted tender and the next highest should have been sufficient evidence of an error either in judgment or in figuring. In spite of these glaring differences, the contract has been let to the lowest tenderer, the proprietor and architect being ready to take the chance of getting more than they are paying for and having the supply man contribute to make up the shortage. We are of the opinion that the law should hold the proprietor for all material delivered on the job, and he and his architect would then satisfy themselves of the responsibility of the contractor before giving him the contract. This, of course, would naturally lead to the weeding out of a number of unreliable and undesirable would-be contractors who have neither capital nor qualification of any sort to rank as such."

Leaves Material Man in the Lurch

James Harriman, of the Simcoe Street Planing Mills, Niagara Falls, Ont., declares: "In regard to the retention of 20 per cent. by the owner to meet unsettled claims for material and labor, I may say, from my own experience, I have found the present act a very serious and difficult one from which to obtain justice. It protects the owner and the scheming contractor at the expense of the man furnishing the material and putting the value into the property. In collusion with an owner, the contractor—who knowingly takes the work below a fair price in order to get it—may draw his pay to the last cent, leaving the man who supplied the material to wait until the contractor gets another job or enter suit and give a lawyer the balance. If a man improves his property and increases its value, I think it only right and fair that he should pay for the material which enhances the value. The lien act should be made so as to cover all the materials entering into the improvements, irrespective of any percentage. It is the duty of the owner to see that all his material is paid for or pay for it himself. Let me give you a case in point: I furnished the material for a building several years ago and a dispute arose; suit was entered, judgment given in my favor, and the money paid into court, and it is there to-day. The lawyer makes all kinds of promises, and I have gone to other members of the legal profession, but am informed that it would be very 'unprofessional' to interfere. In justice to all, the lien act should cover all materials furnished, and the owner should see to it, without any expensive law costs and delays."

Dealer Runs Great Deal of Risk

McClellan & Co., of Bowmanville, remark: "The present act is, of course, better than no protection at all, but, as you state, there are so many loopholes that unless the contractor is both honest and competent, the dealer runs a great deal of risk in supply material without a definite understanding with the owner as to payment. We believe that whatever arrangement is made as to payments should provide that an equitable portion of these payments should be made directly to the dealer who supplies the goods if he so desires, or does not care to accept the contractor for payment. We think, also, that any person or firm engaged in contracting should be under proper government inspection or license, and be obliged to give some kind of security as to their financial standing and ability to pay, as our experience has been that a great many of the so-called contractors operating now have little or no financial backing, and have not sufficient judgment or calculation to estimate what a job is worth, either as to material or labor. There are probably other suggestions that could be made, but these have come under our personal notice, and we have lost a good many hundreds of dollars through dishonest and incompetent men."

More Protection Is Required

The McLaren Lumber Company, of Brockville, assert:

"We think the owner should be responsible for the payment of

all wages and materials in connection with the building, and if the law could also be made so that he could not mortgage the building without the production of receipts, or waivers, from the material supply men, it would be quite a protection.

"We understand that a number of Toronto dealers were favorably impressed with the lien law of the State of Michigan, which was explained to them on the occasion of an association trip to Detroit.

D. Aitchison & Co., of Hamilton, are of the opinion that the Mechanics Lien Act should be amended so that the owner would be held responsible for all material delivered to the building by order of the contractor, as they feel that the supply man has no adequate protection unless such provision is made.

"It sometimes happens that a contractor makes a mistake in his figures, which mistake is quite evident to the owner and architect when they are compared with the other tenders. Notwithstanding this, the low tender is accepted and the contractor is allowed to proceed with the work, when it is quite evident that he will lose money on the job; and, if he is not a responsible person, those who are supplying him will be the real losers," they conclude.

W. Mitchell, of the Thorold Planing Mills, Thorold, Ont., says: "We are strong advocates of the owner being held responsible for all wages and material in connection with a building, and would like to see such a change effected if we could get it. The present act is scarcely worth using for the retailer to-day, as it seldom meets anything at all after expenses are paid."

Amendments to Mechanics Lien Act

At the recent session of the Ontario Legislature, a bill was passed to amend the Mechanics' and Wage Earners' Lien Act. The proposed amendments were introduced by Mr. Proudfoot, but several of the clauses were eliminated by the legal committee of the Ontario House. The interests of the retail lumbermen were looked after by Mr. W. C. Irvin, of Gibson, McCormack, Irvin Company, Toronto, and Mr. John Jennings, of the legal firm of Clute and Jennings.

While the proposed amendments do not go as far as desired in the protection of the interests of the lumbermen, they are a step in the right direction. It is intimated that at the next session of the Legislature, a new bill will be introduced, embodying many points which the trade would like to see covered and are referred to more fully in another column.

The amended clauses now read as follows, the changes being indicated by black type:

Section 6.—Unless he signs an express agreement to the contrary, and in that case subject to the provisions of Section 4, any person who performs any work or service, upon or in respect of or places or furnishes any materials, to be used in the making, constructing, erecting, fitting, altering, improving or repairing of any erection, building, railway landing, wharf, pier, bulkhead, bridge, trestle work, vault, mine, wall, excavation, fence, sidewalk, pavement, fountain, fish pond, drain, sewer, aqueduct, roadbed, way, fruit or ornamental trees or the appurtenances of any of them for any owner, contractor or sub-contractor, shall by virtue thereof have a lien for the price of such work, service or materials, upon the erection, building, railway landing, wharf, pier, bulkhead, bridge, trestle work, vault, mine, wall, excavation, fence, sidewalk, pavement, fountain, fish pond, drain, sewer, aqueduct, roadbed, way, fruit or ornamental trees or appurtenances and the land occupied thereby, or enjoyed therewith or upon or in respect of which such work or service is performed or upon or adjacent to which such materials are placed, or furnished to be used, limited, however, in amount to the sum justly due to the person entitled to the lien and to the sum justly owing, except as herein provided by the owner.

Sub-section 2 of Section 16.—Materials actually brought upon or adjacent to any land to be used in connection with such land for any of the purposes enumerated in Section 6 shall be subject to a lien in favor of the person furnishing it until placed in the building, erection or work, and shall not be subject to execution or other process to enforce any debt other than for the purchase thereof due by the person furnishing the same.

Sub-section 1 of Clause 8.—Save as herein otherwise provided, the lien shall attach upon the estate or interest of the owner in the property mentioned in Section 6.

Section 8 of the Act is amended by adding thereto the following sub-section:

(4) The selling value of land incumbered by a prior mortgage or other charge, shall be deemed to be increased by the value of the work or service performed upon and of the material furnished or placed upon or adjacent thereto.

Sub-section 2 of Section 14.—Save as herein otherwise provided where there is an agreement for the purchase of land and the purchase money or part thereof is unpaid, and no conveyance has been made to the purchaser, he shall for the purpose of this Act be deemed a mortgagor and the seller a mortgagee.

The Basis of Rating Retail Lumber Yards

Under the Provisions of the Ontario Workmen's Compensation Act—Dealer who does not Operate Planing Mill May be Given the Teaming Rate

The members of the Ontario Retail Lumber Dealers' Association are offering some criticism of the Workmen's Compensation Act as applied to class four. At the last meeting of the Central Ontario district, the matter was brought up and thoroughly discussed. One of the clauses which came in for considerable objection, was sub-section "p" of clause 2, which reads: "Workman" shall include a person who has entered into or works under a contract of service or apprenticeship, written or oral, expressed or implied, whether by way of manual labor or otherwise, but shall not include an outworker or a person engaged in clerical work and not exposed to the hazards incident to the nature of the work carried on in the employment."

Clause 12 is another one on which criticism was raised. It reads: "Where compensation is payable out of the accident fund an employee, who is carried on his pay roll at a salary or wages, which the Board deems reasonable, but not exceeding the rate of \$2,000 per annum, shall, if such salary or wages were included in the then last annual statement, furnished to the Board under section 78, be deemed to be a workman within the meaning of this Act and shall be entitled to compensation accordingly, but for the purpose of determining the compensation, his earnings shall not be taken to be more than the amount of his salary or wages as shown by such payroll and statement."

Some Features Not Favorable

Writing to the "Canada Lumberman" recently a leading retail dealer voices his objection to these particular clauses by saying that many a member operated a yard and a planing mill in connection therewith. Half of his working force might be employed in the yard and the remainder in the mill, yet on the whole annual wage bill the retailer had to pay into the Board one and one-half per cent. on the wages of the entire staff. Then he adds: "There are other retail dealers who purchase all their sash, doors, blinds and interior trims and engage a force of men, yet such employers are exempt from the provisions of the enactment because they do no manufacturing. Now what should we have to pay on all the men who are in our employ, whether they work in the planing mill or not? Those on the outside never enter the factory and are in no more hazard than the persons employed in yards which, because of having no mill, do not contribute anything to the compensation of employees. I contend that any one in the lumber business, with or without factory, who employs help, should be brought under the provisions of the Act; or on that portion of our staff engaged solely in duties in the yard, we should not be called upon to pay the annual assessment. This overlapping is unfair and one sided. The employer who has a factory pays for every one in the service, while the retailer, who has no plant, escapes free of any levy. Builders' supply men, who have help, should be assessed the same as those owning a plant. The men in our yard are under no greater danger than those employed by another man who escapes the taxation on labor. All builders' supply men hiring help should be treated alike under the provisions of the Act. For us to be assessed on half of our staff (engaged solely in the yard) is a financial handicap and is, in my opinion, neither fair nor just. We should be relieved of the assessment of the wages of the men in the yard or as already pointed out, all yards should be compelled to come under the stipulations of the Act."

"Now in regard to paying on the wages of members of the firm, I venture the statement that the majority carry accident and other protective insurance, and are thus amply safeguarded, and why this extra levy on wages? In our establishment here the only member on whom we do not have to pay is the lady bookkeeper. Even if any of us meets with an accident or is sick, it is necessary to come to work if at all possible, to see that things are going right. We cannot lay off if it is physically possible to get around, as business requires the closest attention in these trying times. To be assessed an extra levy under the Act, is calling for an expenditure which I consider is not reasonable when we are subject to no danger and carry accident insurance in various companies."

Some of the Clauses Explained

In order to get enlightenment on the points raised, the "Canada Lumberman," in an interview with the Chairman of the Workmen's Compensation Board, Mr. Samuel Price, secured some timely information. Mr. Price said that the schedule of industries in the lumber,

builders' supply and woodworking line come under Schedule I., Class 1 and Class 4, which are as follows:—

Class 1.—Lumbering; logging, river-driving, rafting, booming; robbing, bark peeling; sawmills, shingle mills, lath mills; manufacture of veneer, excelsior, staves, spokes, or headings; lumber yards (including the delivery of lumber) carried on in connection with sawmills; the creosoting of timbers.

Class 4.—Planing mills, sash and door factories, manufacture of wooden and corrugated paper boxes, cheese boxes, mouldings, window and door screens, window shades, brooms or brushes, carpet sweepers, wooden toys, articles and wares or baskets, matches or shade rollers; lumber yards (including the delivery of lumber) carried on in connection with planing mills or sash and door factories; cooperage, not including the making of staves or headings; carpenter, joiner, or cabinet work in shop.

"It is to be remembered," continued the Chairman, "that lumber dealers and builders' supply dealers as such are not covered by the provisions of Part 1 of the Act unless they apply to the Board to be brought under, which may be done under an amendment passed in 1916, section 76a, which reads:—

(1) The Board may, upon the application of an employer, add to Schedule 1, for such time and upon such terms and conditions as the Board may determine, any industry or part of an industry, or department of work or service, of such employer.

"In the foregoing case the lumber yard is given the teaming rate, which was \$1.40 for 1917, and is again fixed provisionally at \$1.40 for 1918. The lumber yard work, including delivery, carried on in connection with planing mills, bore last year a rate of \$1.80, but as the experience in Class 4 was not very favorable for 1917 and a full year's medical aid is to be provided for in 1918 as against a half year's medical aid in 1917, the rate for 1918 has been provisionally fixed at \$2.00 for lumber yard work incidental to planing or moulding mills or sash and door factories. In such a case men employed exclusively in the yard are not separately rated. Purely commercial lumber yards—that is to say, where the employer is a dealer buying and selling his lumber, and not manufacturing it—will, where included, bear the \$1.40 rate provisionally for 1918.

"As to the matter of applying to the lumber yard work incidental to a factory a different rate than that applied to the factory, it has not been the practice in Ontario up to the present to do so. As a general principle it is not felt desirable to attempt too much segregation of different operations in the same employer's industry, a practical difficulty being getting accurate segregations. It is to be remembered that under the provisions of the Ontario Act the problem of rating is merely one of collecting equitably from the employers the money that has to be had for payment for accidents—that is to say, it is merely a matter of distributing the burden equitably among the employers liable to contribute. When all employers in the class are dealt with alike there is no unfairness unless conditions or circumstances among the different employers in the class materially vary. It is of no consequence to an employer in one class how employers in another class are rated, as each class of industry in the schedule stands upon its own footing. The Board, however, is agreeable to making segregations where the equitable apportionment of the burden among employers in the class seems to require it, and where it is practicable to get a reliable segregation of the wages. Where all the rates are low, however, the need of segregation is much less urgent than where some of the rates are high.

The Ontario Rates are Low

"The rates in Ontario, generally speaking, are very much lower than the rates in other places having similar laws, though some of these provide smaller benefits for the workmen. Here are a few comparisons that will be interesting:—

Industry	New York 1917	Michigan 1916-7	Ohio 1917	Ontario 1917
			(Adjusted rate)	
Planing Mills	3.81	1.76	1.90	1.80
Teaming	4.37	1.76	2.75	1.40

Saw Mills	9.54	3.06	3.85	1.10
Logging	9.14	3.35	2.15	.90

"In the above figures both the Ohio and the Ontario rates are preferred rates, subject to a percentage of increase in the case of employers whose accident experience is bad. The Ontario 1918 provisional rates for the above mentioned operations are as follows:—

Planing Mills	\$2.00
Teaming	1.40
Saw Mills	1.50
Logging	1.20

"It is to be remarked that the experience of the lumbermen's class, Class 1, was exceedingly good for 1917, especially in respect of the woods operations—hence the very large retroactive reduction in rates. A circular is being issued to employers with assessments.

The Interpretation of Clause Twelve

"In reference to the provisions of Section 12 of the Act, under which an employer may cover himself and obtain compensation in case of accident, it is to be remembered that this clause is operative only when the employer or partner, or in the case of an incorporated company an executive officer or executive officers, elect when sending in their pay roll statement to the Board to be covered. In this event they are required to put down the yearly salary or amount upon

which they are to be rated and upon which compensation will be based in case of accident; this amount, however, not to exceed the rate of \$2,000 per annum. No assessment is made on the salary of such persons unless they elect to be covered, and of course, no compensation is payable to them unless they so elect prior to the time of the accident. The rate of assessment upon such salary is the same as that upon the wages of ordinary workmen in the industry, but as mentioned, there is neither assessment nor compensation unless election is made by the employer, partner, or executive officer in question.

"The term 'executive officer' was added to this clause by amendment made in 1917. Before this an executive officer, being in the eyes of the law an employee of the company, was required if he took part in the operations of the industry to be included without election, but the amendment now places him upon the same footing as an individual employer or partner. The term 'executive officer,' however, only includes president, secretary, or director, etc., of the company—that is to say, it means an officer of the corporation as such, not a manager or superintendent of the business who is not an officer of the corporation. The wages of such manager or superintendent not being an executive officer of the corporation are required to be included in the same way as ordinary workmen, and such manager or superintendent is entitled in case of accident in the employment to compensation."

Wireless As An Aid to Forest Protection

Wide Difference of Opinion as to Its Efficiency, Economy, and Reliability—Will Its Application Be Necessarily Limited?

"Wireless Telegraphy" as a practical factor in detecting and preventing forest fires was the subject of an interesting and timely article which appeared in the last issue of the "Canada Lumberman." The proposition was ably presented by William L. Fletcher, who is the sales manager of a large radio manufacturing firm.

In this issue are given the opinions of several leading Canadian foresters and others on the reliability, efficiency, and economy of "wireless" in protecting the timber wealth of the Dominion. It will be noted that their views in regard to its possibilities and advantages differ materially.

R. H. Campbell, director of forestry, Ottawa, observes: "We have considered the application of wireless telegraphy to forest protection in connection with our administration to a considerable extent, but on account of the war have not been able to make any definite efforts to try out its practicability. Undoubtedly it will have a certain field in connection with forest protection work, but it is also subject to certain limitations, one of which is the necessity for trained operators for transmitting and receiving messages. At the present time I do not feel in a position to make any very definite statements in regard to the question."

Somewhat Doubtful of Its Benefits

E. J. Zavitz, provincial forester of Ontario, says that the Western Forestry and Conservation Association has been investigating the application of wireless telegraphy in forest protection, but so far has not made any practical application of the system. Mr. Zavitz adds that the local conditions in Ontario would lead him to believe that wireless would be of little assistance in the work of the department, as wireless could only aid in locating and reporting fires. He declares that the detection of forest fire is not a difficult matter through lookout towers and observation stations. "Our problem," he states, "is to have the territory so organized that men can reach a fire in the shortest time. I can see no advantage in sending messages long distances regarding fire, because the problem is to have men within available distance to actually fight fire when it occurs. I consider forest fire protection a very local problem, with each unit of territory so organized that it handles its own problems. We can put up observation points and communications at a comparatively low cost as compared to wireless, and all that wireless can be used for is to assist in reporting fire. The application of wireless would, of course, require expert officers in the field. If the aeroplane becomes available in this work there is a likelihood that wireless may be of some practical assistance. From these remarks I do not wish you to infer that I have any preconceived notions against wireless, but, so far as I can learn, no forest protective organization has yet made any practical application of it."

Feasible Only to Limited Extent

A leading member of the Commission of Conservation, Ottawa, says: "I am posted only in a general way with reference to the possible application of wireless telegraphy to forest protection. I am of the

opinion that wireless will in the future constitute a valuable feature in fire protection work under some conditions. I think, however, that its application will necessarily be somewhat limited. I do not understand that wireless equipment has yet been developed to a point where its use is feasible to more than a very limited extent at the present time in fire protection work. However, developments are taking place very rapidly in connection with military operations at the front, and there seems every reason to believe that at some time after the conclusion of the war the wireless telegraph may prove a much more valuable factor than is now practical in connection with a number of phases of fire protection. One of the factors which will necessarily limit the usefulness of the wireless telegraph is that the generating equipment necessary for sending messages from the field is too heavy for a fire ranger to carry with him. He must accordingly depend upon other means for notifying the head office of fires which he may discover. At the same time communication between permanent stations is apparently quite feasible at a fairly reasonable cost at the present time."

Investigating Wireless Telephones

Ellwood Wilson, chief forester of the Laurentide Company, Grand'Mere, Que., who is spending a few weeks in California, writing from San Francisco, under date of March 18, says: "In 1908 we used a wireless receiving station, and found it satisfactory. Unfortunately, there has not yet been invented a good portable wireless apparatus which can be used by rangers under our conditions. Just as soon as such an apparatus is on the market we shall have it. Wireless telegraph apparatus has not yet been developed to the point where it is feasible for our forest protection work. I am investigating wireless telephones here. You are perhaps aware that for many uses this means of communication is perfect, and the United States Forest Service were, at the beginning of the war, experimenting with portable outfits. I am now in touch with them. Should anything of interest develop I will write you."

Regarding the economy and reliability of wireless telegraphy as applied to safeguarding the wooded wealth of Canada from the ravages of fire, G. H. Prince, of Fredericton, N.B., director of the Forestry Division, Department of Lands and Mines, says: "I think that it can be used commercially in forest protection, and I believe, as you know, it has been done to some extent in California."

Frank I. Ritchie, manager of the lumber department of the Wayagamack Pulp and Paper Company, Three Rivers, Que., writes: "Regarding the adaptability of wireless for safeguarding the timber limits against fire, I think, of course, that if it could be done economically in connection with aeroplane patrols it might be all right. I do not believe that it could be put into use profitably for the next few years."

Sees Great Possibilities in Wireless

W. F. V. Atkinson, chief forester of the Spanish River Pulp and Paper Mills, Sault Ste. Marie, Ont., states:

"I recently had a long interview with Mr. Fletcher, who is a tech-

nical man and thoroughly conversant with his apparatus. The result of my conversation with him was that I have come to the conclusion, subject to certain guarantees as to strength and efficiency, etc. (which a forest engineer, as well as anyone who is not familiar with radiography, must obtain), that this method of communication is reasonably economical for forest fire protection purposes, and can be effectively operated at outstations and erected and operated in case of emergency by men with a short training from among the class who should be employed for forest fire protection work. Of course, the district chief will always have the trained assistance needed to operate the headquarters plant.

"The great value that I see in the semi-portable portable wireless plant is that no winds or intervening fires can cut the lines of communication. It might not be as satisfactory for short distances as a single wireless telephone, and should be used at first to communicate between local centre points having their own telephone lines to lookout stations. At some of the more important lookout stations, requiring a better trained man, it might be used directly from the lookout house if designed for that purpose.

"Amongst other things required for the quick and intelligent use of the wireless is to formulate a brief form of report which will, without any possible ambiguity, clearly explain, first, where a fire is seen, exact direction, and probable distance; second, size of fire; third, wind direction; fourth, temperature; fifth, rain, cloudy, or clear; sixth, expectations; seventh, requirements; eighth, remarks. As this wireless

Griffith B. Clarke, president of A. R. Clarke & Co., Toronto, manufacturers of "A.R.C." clothing for lumbermen, who expects, with the advent of spring, to be the first to enjoy a spin on Toronto Bay in his speedy motor boat, "The Leopard." It is equipped with a 135 h.p. six-cylinder marine engine and capable of a speed of forty miles an hour. Mr. Clarke is seen at the wheel. "The Leopard" was second in the competition for the gold cup at the Canadian National Exhibition, Toronto, in 1917, being beaten only by 19 seconds over a 28-mile course and by a boat of 250 h.p.

is a telegraph, and not a telephone, the message should always be brief and clear, with a form to make it so.

"Messages might properly be classed and given precedence in the order named—first, notice of fire message; second, instructions message; third, report message, and, fourth, general message, with an emergency or help call to be picked up by any or all other stations. As 'S.O.S.' is a ship call, it should never be used. I would suggest 'S.Y.' in its place.

"The difficulty of continuous 'listening in' for calls is not so bad as it seems at first, as this will have to be the constant duty at headquarters and a periodical duty at out-stations. Each wireless station should always be sufficiently powerful to reach beyond its local headquarters in case it becomes necessary to get help elsewhere, but disappointment will result if apparatus to be moved about is too heavy. For short distances and poorer class of help the telephone is less costly and more satisfactory, as you can get at the feelings of the party reporting better by telephone than by telegraph; men of a certain practical class will say a great deal more than they will write. As it is necessary for the local fire chief to see the trouble through their eyes, a certain amount of questioning is often needed to convey a correct impression to him.

"To sum up, I may say that, in my opinion, wireless telegraphy is of great value for forest fire protection work, but that it is not all-sufficient; if used for the present in conjunction with short telephone lines it will be more economical and satisfactory. As time goes on and men are trained to use it regularly, no doubt it will become of greater

value still. It is invaluable, of course, as a temporary means of communication during an emergency, and I understand the motor power required can be generated from a gasoline engine sufficiently light to be easily carried to the required place.

G. C. Piche, chief of the Forest Service of the Department of Lands & Forests, Quebec, writes: "I think the application of wireless to the protection of our forests should be very seriously considered. In a rough country like the Laurentian plateau it would be easy to establish such posts. We have already a few lookout stations distributed over our territory and there is no reason why each one of them should not be equipped with a wireless apparatus so as to communicate the news rapidly to the head office. As you know, the St. Maurice Protective Association will most likely try the use of an hydroplane over their area, and this machine will be equipped with a wireless. This will naturally mean that at least one station must be established in the St. Maurice section. I think it will be a great economy and will help vastly in the safeguarding of our timber limits against fire. I regret to be unable to furnish you with any data on the efficiency of this system adapted to forest protection, but from the success obtained elsewhere, I think that we are justified to go ahead."

Discussed in the West Five Years Ago

Another enthusiastic forester writes: "I do not know that there is anything of particular value that I can add to the discussion at the present time, in view of the fact that Mr. Fletcher is a recognized authority on the use of wireless, and covered the ground pretty fully in your last issue. There is, however, one point to which I do not recall special reference having been made at the Montreal meeting. This point was raised in connection with the discussion of wireless telegraphy for forest fire protection purposes, at the Forest Fire Conference held at Vancouver, B.C., December 15 and 16, 1913, under the auspices of the Western Forestry and Conservation Association. At this meeting, Mr. J. R. Irwin, of the Marconi Wireless Telegraph Company of America, gave a very interesting talk from which the following is an extract:

"We are in a position to supply you with portable outfits which can be carried upon muleback and are built for strength and efficiency, and I shall first roughly describe which I consider the best unit for your work. It is estimated that the average mule pack is 90 pounds on each side of the saddle. We first adapt a saddle for our peculiar uses, utilizing it after it has been off-saddled, as a stand or instrument table. Upon one side of the saddle we carry a small gasoline engine somewhat similar, but lighter than a motor-cycle engine. This is directly connected to a small alternating current generator which supplies us with the electrical power necessary to operate the wireless equipment. This piece of apparatus is the heavy part of the outfit and would occupy one side of the load. Upon the other side is a half-kilowatt transformer, or as the case may be, smaller as the use for which it is required is considered. The half-kilowatt transformer is the heaviest piece of the actual wireless set, and weighs approximately 25 pounds. On the same side of the saddle are located the condenser, helix, operating key and other small parts weighing comparatively but a pound or two. Here we also have the receiving outfit, which also weighs a trifle, and could be carried in the pocket. On top of the saddle is the spool upon which is wound the antenna wire used for the aerial; this is of light flexible aluminum wire and is not weighty. A portion of it is also used as ground connections. Fuel is carried in tubes or tanks conveniently fitted on the saddle—also light bamboo rods fitted like a fishing-pole for a mast where high trees are not available. It is an idea of my own which I have not yet been able to determine if practicable, that gasoline could be carried in these mast tubes, thereby saving weight and space. This entire outfit can be off-saddled and quickly adjusted, as it is practically set up upon the saddle.

The point which I particularly had in mind is contained in some remarks, following Mr. Irwin's paper, by Mr. E. T. Allen, Forester and Secretary of the Western Forestry and Conservation Association. This is contained in the following extract from Mr. Allen's discussion:

"I think the most of us who have been considering wireless have done so rather skeptically because of the expense and because we have been pretty well satisfied with telephones where we have them; but I think it is fairly well demonstrated that we have certain occasions in which the telephone will never do the business. One of these is in districts in which it does not pay you to build a telephone line into remote areas in which the telephone problem is difficult and expensive, the line costing \$30 a mile and up. We also have emergencies in big fires in which we have no telephone line. It has seemed to me personally that whether or not we find wireless very important in our work we are going to need it.

Travellers Boom Retail Association

Presentation to Two Aggressive Salesmen Who Secured Most New Members in Recent Campaign

An interesting event took place at the Board of Trade rooms, Toronto, on March 16, when a number of travellers for wholesale lumber firms assembled to hear the result of the recent contest which had been conducted toward securing new members for the Ontario Retail Lumber Dealers' Association.

The executive offered a box of choice cigars to the salesman who was successful in securing the largest number of names within a month. The contest was a very spirited one, and many firms joined as a result of the activity and interest manifested by the travellers.

Donald Barclay, representing the Canadian Western Lumber Company presided, and called upon Horace Boulton, secretary of the Ontario Retail Lumber Dealers' Association, to read the results. Mr. Boulton said it afforded both the association and himself much pleasure to witness the interest which the travellers had developed in the competition, and assured them that their sympathy and support was appreciated. In the contest Cornelius Schmidt and A. Dick, both of the R. Laidlaw Lumber Company were each successful in obtaining thirteen new members, although several others were quite close to them in the results. Mr. Boulton said that he had much pleasure, therefore, in presenting Mr. Schmidt and Mr. Dick each with a box of fifty fragrant Havanas, which the recipients passed around that all might test the brand.

It is announced that a second competition may be inaugurated at an early date, when another meeting of the road salesmen will be held.

C. Schmidt, Toronto.

Alex. Dick, Toronto.

Mr. Schmidt and Mr. Dick, in acknowledging the gift, spoke of their interest in the work, and wished the Retail Lumber Dealers' Association every success.

The representatives present then gave their various experiences in connection with the canvass for membership and some of the objections that they had to overcome. Among the misconceptions that exist in the retail trade are that the organization is a body to fix prices and regulate competition, whereas nothing is further from the thought or purpose of the association than this. It is distinctly stipulated in the constitution that no attempt is to be made to limit or control prices, directly or indirectly, but it appears difficult to convince some of the smaller men in the outlying towns that there is not an Ethiopian on the fence somewhere. However, it is expected that time will correct all erroneous views. Other dealers did not like to be identified with the organization just now because they belonged to similar bodies in years gone. These had gone to the wall, and, therefore, they did not have much faith in the present movement.

It was pointed out by one of the speakers that the hardest man to secure was he who had been identified with previous organizations which had ceased to exist and, because he had tried once, had no faith in future efforts, no matter by whom undertaken.

Another wrong impression that prevailed in the minds of a few was that travellers were boosting the retail membership for some personal gain or benefit. Of course, this statement was promptly disproved. All the good work done by the road representatives has been done solely out of good-will and warm sympathy for the association, the usefulness and benefit of which travellers recognize. They realize that an active retail body can do much to place the trade on a firm footing and a more progressive basis.

Another barrier raised by certain firms was that a few wholesale

dealers were selling to contractors, and this was objected to by the retailers. It was pointed out that it was the intention of the association to put a stop to the practice of any wholesaler doing such a trade, and that every effort would be made to protect the interests of the retail lumberman.

In the course of the discussion plans were outlined for meeting some of the foregoing arguments when they crop up and inducing everyone within the various districts to become identified with the association.

The secretary reported that there were now over 100 paid-up members, and cards have been signed by many more, so that the prospects were exceptionally promising.

Cornelius Schmidt, one of the winners in the campaign for securing the largest membership, resides in Toronto, and has been with the R. Laidlaw Lumber Company for seven years. He covers the main line south from Toronto to and including Detroit and also several of the principal centres in New York State. Previous to removing to Toronto, Mr. Schmidt was inspector with Collins Inlet Lumber Company, on the north shore. He began his career in Collingwood, where he spent his boyhood days. Mr. Schmidt is a hard worker, and secured thirteen members in less than a week's time.

Alex. Dick, who divided the honors with Mr. Schmidt, has been with the R. Laidlaw Lumber Company for the past two years, and covers Western Ontario north of the main line. Born in Scotland, he early became identified with the lumber industry. Since coming to Canada twelve years ago he has been associated with several leading firms, and for four years was superintendent for John Lumsden, Lumsden's Mills, Kippewa, P.Q. He entered upon his present duties in 1915.

May Extend The Bureau Service

Proposition Being Considered by Wholesale Lumbermen to Cover All Eastern Canada

Many important matters were discussed at the regular monthly meeting of the Wholesale Lumber Dealers' Association, which was held at the Queen's Hotel, Toronto, on Friday night, March 22. Owing to the absence of Chairman, Mr. A. E. Clark, who was out of the city, Mr. A. E. Eckardt presided at the dinner, which was followed by the usual business proceedings. There were twenty-four members present, including a number of visitors, among them being Mr. Guy H. Long, of the Long Lumber Company, Hamilton; Mr. Thompson, of W. C. Edwards & Company, Ottawa, and Mr. Frank Hawkins, Ottawa, secretary of the Canadian Lumbermen's Association. Secretary Boulton reported two new members and the Transportation Committee representatives reported encouraging progress in connection with their interview with the railway officials in regard to the stop-over service. They stated that, at the conference with the railway men, a lot of definite information on the subject had been brought out, which would relieve the members of any mistaken ideas entertained by the railways. It was intimated that this matter would likely come up before the Board of Railway Commissioners, and it was important for the lumbermen to have their case presented as strongly as possible.

The Chairman reported that, in the afternoon, a conference had been held between the members of the association and other lumbermen, including Mr. Frank Hawkins, secretary of the C. L. A., at which a lengthy discussion had taken place on the possibilities of extending the bureau of information service to include members in Ottawa, Montreal, and other important eastern centers. While the discussion was purely tentative in character, the wholesalers, who were present, declared that they would be much pleased to have the opportunity to co-operate in the credit information service.

The suggestion was offered that means might be found to operate the service for the whole of eastern Canada from the present head office in Toronto, and that possibly the entire service might be developed into a branch of the Canadian Lumbermen's Association.

While this plan was not decided upon definitely, it had many features which commended themselves to the representatives of the Wholesale Lumber Dealers' Association, after it had been pretty fully considered at the meeting in the evening.

A resolution was passed to the effect that the directors of the Wholesale Lumber Dealers' Association should hold a meeting with the directors of the Canadian Lumbermen's Association for the purpose of discussing the whole proposition.

Mr. Frank Hawkins gave an interesting address on the work of the Canadian Lumbermen's Association, and Mr. Thompson also spoke on some of the present difficulties of the manufacturers, with particular reference to the transportation problem. There was also a rather long discussion on the question of car stakes, but no decision was reached on the matter.

Will Adjust All Trade Disputes

Valuable Service Will Be Rendered By Retail Dealers Association in Healing Any Breaches

The Directors of the Ontario Retail Lumber Dealers' Association held a meeting at the offices of the Association in Toronto on March 26th and disposed of a large amount of business. The most interesting portion of the meeting was the report of the Secretary, which showed that the Association is making substantial progress and will undoubtedly be a strong factor in the promotion of the interests of the trade.

Although the Association has only been in existence for a few months, its membership list as shown by the Secretary's report, is very encouraging, and includes 112 firms, which is estimated to be about twenty-five per cent. of the available members. The means that have already been adopted for securing new members will be continued and a still more vigorous campaign will be inaugurated.

While attention is being devoted strongly to the matter of membership, the actual work of the Association is not being neglected and many important matters are being dealt with. An example of this is the decision which was reached at this meeting of the Directors to have a Bill for a new Mechanics' Lien Act for Ontario prepared and presented at the next session of the Ontario Legislature. The proposed Bill will make the owner of a building responsible in full for the payment of all bills for material and labor. This decision was reached as the result of the success already secured by members of the Association in co-operation with other supply firms in having several important amendments to the Act carried by the Legislature at its recent session.

Go Before Arbitration Committee

One of the ways in which the Association proposes to be of value to its members is in giving attention to disputes arising out of breaches of the generally accepted rules of trade ethics. Already, the Secretary reported to the Directors, a number of cases under this head have been laid before him by members of the Association and on the instruction of the Directors he is dealing with each case as it appears to him, on its merits, communicating with each party, enquiring into all the particulars, laying them before the committee on arbitration whenever necessary and bringing about a mutually satisfactory arrangement whenever possible. When it is found that such an arrangement cannot be reached the further step will be taken of calling a joint meeting of the arbitration committees of the Ontario Retail Lumber Dealers' Association and the Wholesale Lumber Dealers' Association, so that the matter may be dealt with by accredited representatives of both parties and an arrangement reached which will settle the matter. Undoubtedly, this means of providing against improper trade methods and ending long-standing disputes will be a valuable service to the members of both associations. Several cases which have been laid before the Secretary of the Ontario Retail Lumber Dealers' Association are now being dealt with by him in this manner.

Will Issue Monthly Bulletin

To keep the members of the Association in close touch with the work it is doing and with the most modern methods of conducting a retail lumber business, the Directors have decided to publish a monthly Bulletin. This will take the form of an Association magazine, which will be sent to the members and prospective members and which, unquestionably, will be a means of linking up the membership. Arrangements which have already been made by the Secretary for the publication of this magazine were reported to the Directors. From its first number this magazine will be self supporting.

Standing committees for the Association were discussed by the Directors and arranged for as follows:—

Committee on Membership—To consist of the committees of the local districts with Mr. J. B. Reid, Toronto, as general chairman.

Committee on Fire Insurance, Employers' Liability and Workmen's Compensation—Mr. W. C. Laidlaw, Toronto, Chairman, with power to appoint general and local standing committees on these subjects.

Committee on Arbitration and Inspection—To be composed of the Secretaries of each district with power to appoint local committees or to call for the assistance of local members to deal with matters under these headings when they develop.

Committee on Legislation and Transportation—Mr. E. M. Barrett, Ottawa, Chairman, with power to appoint general and local standing committees on these subjects.

Several other matters were disposed of by the Directors, of a more or less routine nature, and the meeting then adjourned.

Those present at the meeting were: Thomas Patterson,

Hamilton, Chairman; J. C. Scofield, Windsor; W. M. Tupling, Orillia; E. M. Barrett, Ottawa; A. G. Rose, Ottawa; K. J. Shirton, Dunnville; B. F. Clarke, Glencoe; and A. S. Nicholson, Burlington.

Co-operation and the Lien Law

The first fruits of co-operation among members of the lumber trade are beginning to ripen, in connection with the Ontario Retail Lumber Dealers' Association. About a month ago a number of retail lumbermen in Toronto who are actively interested in the Association began to discuss the Mechanics' and Wage Earners' Lien Act of Ontario and to consider the best means of bringing to the attention of the Legislature the necessity for having the Act in its present form amended so that it would become what its title indicates, rather than an act to enable a dishonest contractor or owner to defraud the material man and the laborer.

When the present Act was passed by the Legislature there is no doubt that it was expected to work out as a protection to the material man, but this has not been the experience. Under its provisions the owner of a building has no responsibility other than to hold back 20 per cent. of the cost of the work as it progresses. Having done so, he is protected against any proceedings which the material man may want to bring against him to recover the price of the goods which he has delivered. It often happens, under such an arrangement, that the contractor makes improper use of the money which he is paid as the work advances, and when the matter develops into a case for the lawyers the material man has no redress against the owner. A contractor and an owner working in collusion are thus able to defraud the material man extensively, and in actual practice this frequently occurs. This is the most important matter in connection with the Lien Act, that needs amendment, and it is one of the matters which remains to be taken up at the next session of the Legislature. It is the intention of the Ontario Retail Lumber Dealers' Association to have a new Bill prepared which will be ready for the next session and which will include a clause making the owner responsible for the full amount of the cost of the building, unless he has obtained from the contractor sworn affidavits setting forth all work done and all material supplied and the cost of the same. Then it is proposed that the owner shall make out checks for the amounts payable to those who have done the work or supplied the material, after which such payments as are due to the contractor may be made. This is a plan that is in operation in the State of Ohio and several other States across the line. It removes the possibility of collusion between the contractor and the owner to defraud the material man or the wage earner.

Owing to the short time available during the recent session of the Legislature of Ontario, this important amendment was not put forward, but the intention is to make it one of the chief features of the proposed new bill. Those who had the matter in hand this year, however, did succeed in having two important amendments passed, for which retail lumber dealers owe them a great deal. The first of these had to do with the delivery of material on an adjoining lot to that upon which a building is being erected. Under the Act as it previously existed it was necessary to make delivery of material actually "upon" the lot in order to be entitled to file a lien for its value. Judgments have been given right along to the effect that if there were not room "upon" the lot and the material were delivered "adjacent to" it, the material man had no right to recover under a lien. This was a hardship and an injustice, and the amendment which has been carried at the request of the retail lumbermen and other supply dealers who co-operated with them in presenting it before the Legislature, eliminates this.

Another important amendment relates to proof of increased value to the land, resulting from the use of the material supplied for a building. Under the Act its former shape, it has been incumbent upon the material man to prove the increased value. The amendment which has been carried says:—"The selling value of land incumbered by a prior mortgage or other charge, shall be deemed to be increased by the value of the work or service performed upon and the material furnished or placed upon or adjacent thereto." The effect of this amendment is to place the burden of proof upon the mortgagee, if he disputes the increased value claimed by the material man or the laborer.

The reason why other amendments which were asked for were not obtained, was that the Legislature was not able to reach the measure until the dying days of the session. Those who had the matter in hand are well pleased that they were able to get the amendments referred to carried. They were advised by the Leader of the Opposition and others who took an interest in the Bill, to prepare a new Bill and have it ready in ample time for the next session. This will be done and strong deputations will be on hand to urge its passage.

The Bunkhouse is Not Yet Outlawed

Says George H. Holt, of Chicago, Who Thinks, However
That It Should Be Improved

George H. Holt, Chicago

George H. Holt, of the Holt Timber Company, Chicago, who operate large camps in both Canada and the United States, is spending some time in Sunny California. At the recent annual meeting of the Canadian Lumbermen's Association, in Montreal, Mr. Holt read a thoughtful and forceful paper on "Feeding the Lumberjack," in which the problem was discussed from an economic, patriotic, and dynamic standpoint.

Writing to the "Canada Lumberman" from San Diego, Cal., in reference to Mr. Fitzpatrick's plan of housing the lumberjack by means of a system of steam-heated cottages, Mr. Holt says:

"I have just perused the article of Mr. Fitzpatrick, and the comments on it, with much interest. I am sitting out of doors, in the

sunshine, with out a coat, surrounded by flowers, within sight and sound of the slow-rolling breakers of the Pacific Ocean, and of fifteen army and navy airplanes coursing the sky. Snow and cold and housing the lumberjack seem far away and quite unnecessary.

"Anyone who makes a serious attempt to solve any of the world problems in these days of Exodus from the Land of Precedent and Habit deserves sober attention. We are all leaving behind the customs of the past, and are 'on the way'—who shall say by what route and how fast and how far? Mr. Fitzpatrick says: 'Courage is in the air.' It certainly is needed. He calls attention to some admitted limitations and shortcomings of life on the frontier as compared with life in a summer resort, and suggests a modern country club, without dues, as the ideal corrective, or perhaps a modern philanthropy-supported sanitarium, on the cottage system, with the entire family as guests for life. I say this is the ideal sketched in his picture, rather than his suggested materialization of that ideal.

Already in Reality in the South

"Probably Mr. Fitzpatrick is aware that the cottage and the single room and double room and family-group system, with and without steam heat, are already realities in the South and in the far West, only more completely developed, including mattresses and pillows, sheets and pillow-cases laundered weekly, hot and cold water, schools for the children, churches and reading and recreation rooms, phonographs, movies, lectures, hospitals, and resident doctors, and private vegetable gardens, chickens, pigs, and cows. So his suggestions are not chimerical unless the contrast in the climate, lay-of-the-land, social conditions, length of operation, accessibility, or something else, render them impracticable.

"These groups are really industrial communities rather than camps, although in many cases the whole community is semi-portable, and is intended to be removed and relocated from time to time.

"Have these progressive establishments solved the labor problem or quieted unrest? The proprietors do not say so, if that is any test, and in some of them the I.W.W. is flourishing furiously. In some parts of the South there is no labor shortage, and the problem there is one of too much rest rather than unrest.

Tried It Once Without Success

"A few years ago I built in Canada a set of camps for 125 men, designed for a five-year operation. The buildings were of peeled logs, eight feet under the eaves, composition roof, roomy, well lighted and heated, fitted with Marcusson double-deck spring bed iron bunks,

white enamel utensils, cutlery extra good, blankets and bedding first class, everything new, spring water, laundry, and hospital. It was accessible, in beautiful surroundings, and soon got the name of 'The Million-Dollar Camp.' That was just before the war, when men were more plentiful.

"The reputation of the camp kept the crew full, but changes were quite as numerous as in the old-style camps and efficiency was lower in that camp than elsewhere. It was too easy. I figured at that time on a central steam plant, as the location was favorable, and we had the steam boiler on hand, but the cost of pipe, fittings, insulation, freight, and labor, when the cost was far less than now, made it prohibitive. Dry stove-wood cost us 90 cents a cord, cut in the summer by contract. We also had phonographs, lectures, violins, and other instruments of musical intention. The camp clerk became a defaulter and has since lost his life at the front, and during the first summer the camp was completely destroyed by a forest fire. Of course, that case proves nothing, but it is a contribution to experience.

"The bunkhouse has its faults, but when you consider the barracks and cantonments in which soldiers are housed, and the kind of quarters supplied to emigrants and sailors on the water, it is not yet outlawed. I agree with Mr. Fitzpatrick, however, in thinking that it can and ought to be improved. It should be a part of a comprehensive study of conditions and remedies to be considered by the War Service Board, with an eye to the future. Of the two, I think there is no doubt that the lumberjack would choose a camp to suit his stomach rather than his idle time and sleep time; and if he were compelled to take a daily or even a weekly bath in winter time he would vamose without warning. That is not true of all, and I think better facilities for personal cleanliness can and should be provided. They are reformatory measures, not a lumberjack demand.

The Employment Agent Criticized

"The employment agent is an evil, not because he is less truthful than the company employment man, but because his interests are adverse to the employer. Unrest of labor means good business for the employment agent. He doubles his charge to the men, gets a bonus from the employer, makes a shave on the railroad fares, gets a free fare for himself and free entree to the camp and free keep while he increases his acquaintance, and builds up a larger following of labor vagrants by stimulating dissatisfaction and unrest and by promising just as good or better jobs at the next place.

"The problems of employment agent and railway fares are merely factors in the larger problem of man-power and its economic use and distribution.

"My idea is that either the lumber associations should handle these problems, through a well-organized department, or that they should be handled as a part of the co-ordinating service of the War Service Board and the government, as indicated in my paper on 'Feeding the Lumberjack.' It seems to me inopportune and futile to undertake to handle these problems in an independent and haphazard and best-guess fashion."

Want Night Schools in Every Camp

There has been a resolution carried by the District W.C.T.U. in Toronto and other women's organizations, which will be sent to the educational department of each provincial government, that night schools for foreigners be established in all camps and works within the province, in view of the fact that Canadian citizenship is likely to become endangered within the next ten years through the loss of Canadian manhood on the field of battle.

The W.C.T.U. also intend to ask the Hon. J. A. Calder, Minister of Immigration for Canada, that he make the laws regarding naturalization more stringent as regards the standard of education required by the applicant for naturalization; further, that the alien be required to apply for naturalization as a British citizen after and on completing ten years' residence in Canada. It is also recommended to the provincial medical officer of health in each province that he require the local medical officer of health in each unorganized district where there are camps or works to investigate conditions and enforce more rigidly the laws of sanitation regarding bath, laundry, etc.

Believes In Quality and Service

Head of Well-Known Woodstock Lumber Firm Says
It Pays to Handle the Best Grades

R. E. Butler, Woodstock, Ont.

"While we do not specialize in any one particular line, we do specialize in 'Quality and Service.' This is our motto, and we pride ourselves that we live up to it," said R. E. Butler, head of the R. E. Butler Lumber Company, Woodstock, Ont., who has been identified with the trade for thirty-six years, having started business in the capital of Oxford County in 1896. The company accept no lumber in their yard which is not strictly up to the mark, and state that they always buy from the mills which put up the best grades.

"We may have to sacrifice a little business occasionally," declared Mr. Butler, "to the man who carries a cheaper line of stock, but we find in the long run that it pays to have the grade. A

good portion of our business is shipped from Woodstock to points within a radius of twenty miles, and in nine cases out of ten the customer never sees the stock before it is shipped. We could not command the business if we dealt in the cheaper grades of lumber."

In their retail business the company handle all Quebec spruce of No. 1 quality and do not stock the merchantable grade. The firm do considerable advertising in the local press and use large space twice a week, with announcements that are neatly set up and well displayed. They make a feature of "Service," and Mr. Butler remarked that in order to live up to it they have to keep a large stock so that they can make quick shipments and look after their yard customers with the utmost despatch. In this connection they endeavor to load orders on cars the same day as received, but, of course, owing to recent car shortage, have not always been able to do this.

Mr. Butler added that they pile all their lumber in separate widths and separate lengths and buy everything in even lengths, and that it is only on very rare occasions they are short in any sizes in hemlock, pine, or spruce. They usually have from one to three cars of shingles on their platform, and this enables them to meet any contingency, such as embargoes or car shortage.

The doors, sash, dressed lumber, and mouldings of the firm are neatly arranged in a double-deck metal shed, 54 feet wide by 110 feet

The Storage shed and office of the R. E. Butler Lumber Company, Woodstock, Ont.

long, and good stocks of lath, cedar posts, long joists and timbers are carried. The firm do not operate a planing mill in connection with their business, but buy all their lumber worked at the mill. Along with the retail, they do an extensive wholesale trade, and emphasize the same methods regarding "Quality and Service" in this particular as they do in their retail operations.

"We devote just as much attention to grades in the wholesale line as we do in the retail end, and have the rather unique record that during the last three years—with but one exception—we have never had any complaints from our customers regarding the grade of our shipments," concluded Mr. Butler.

Timber Leads in War or Peace

How the forests of Great Britain, France, and Germany have been the real masters of the war situation, and how the forests of Canada are looming up as the dictators of future foreign trades was outlined before the Kiwanis Club, Ottawa, recently by Mr. Robson Black, secretary of the Canadian Forestry Association.

Mr. Black told of the herculean efforts of all the belligerents to obtain timber with which to build huts, railways, trench linings, dug-outs, and a hundred other necessities of defence and offence. Only the slaughter of British forests by Canadian forestry battalions saved the nation from a serious dilemma, and only the foresight of French foresters a century ago in providing splendid timber areas enabled the allies on the western front to counter the German thrusts. France was now hewing down 30,000 trees a day to meet military requirements.

Mr. Black placed the forests of Canada as the winning card in future export trade, second only to agriculture. "Forest industries stand in the middle of the road of Canada's economic development. We cannot compete with the Germans in cheap watches, but we can outdo any nation in the products of the spruce tree. Enough time and public money has been spent on industrial exotics. It behooves Canadian governments to-day to make their policies square with the rock-bottom fact that Canada can make money fastest by throwing the exotics out of doors and paying heed to the cultivation of the land, the forests, the mines, fisheries, and water-powers.

"The forests of Canada pay more of the country's foreign debts than all other manufactured goods put together. They hold more capital, employ more men, pay more wages than any other business we have except agriculture. And yet they are running rapidly down hill, particularly in Eastern Canada. Fire has cleaned out two-thirds of the original stock, and even to-day in the midst of cries of more production, the fire fiend is wantonly allowed to sweep off enormous amounts of timber than cannot grow again from fifty to a hundred years."

Mr. Black predicted that if export trade was to be retained and developed, if the main support of industrial life in the Dominion was to be upheld, the Dominion and provincial governments would be forced to bring their forestry policies out of the back kitchen and place them in the forefront of their deliberations and activities.

National Association Meets in Chicago

At the sixteenth annual meeting of the National Lumber Manufacturers' Association, which will be held at the Congress Hotel, Chicago, on Monday and Tuesday, April 8 and 9, an interesting and instructive program will be presented.

On April 8, in the morning, there will be a trade extension session, at which President R. H. Downman, of New Orleans, La., will give an address. K. V. Haymaker, of Detroit, and J. R. Moorehead, of Kansas City, Mo., secretary of the Southwestern Lumbermen's Association, will speak on "Building and Loan Associations." H. R. Isherwood, retail representative, will present a paper on "Retail Co-operation," while "Developing the Use of Timber" will be discussed by C. E. Paul, construction engineer. Dr. H. von Schrenk, consulting engineer, will talk on "Fitting Lumber to Consumers' Needs." A general discussion on important matters will follow the reading of the papers.

In the afternoon there will be a governmental relations session, when the following will take part: "War Service Committee," by W. H. Sullivan; "Building Codes," by R. S. Whiting, architectural engineer; "Traffic Committee," by E. A. Selfridge, Jr., and "National Policies and the Lumber Industry," by L. C. Boyle. In the evening at 7 o'clock the annual dinner will take place, when leading representatives of the trade and allied lines will give addresses.

On April 9, during the morning there will be a stock-holders' meeting and the election of directors, following which will be a sederunt of affiliated organizations. The report of the Pacific Coast Committee will be presented by E. D. Kingsley, chairman, after which there will be six-minute talks by representatives of various associations on "What We Are Trying to Do Through the National Association."

Produced Ten Thousand Carloads of Shingles

The sale of the British Columbia red cedar shingle is on the increase; in spite of the stiff competition of patent roofings. In 1917 the shingle manufacturers of the Pacific Coast province had the best year in the annals of the industry.

Some idea of the extent of the production may be gained from the fact that it would require over ten thousand cars to move the output of 1917, or, in other words, a train of thirty-five cars every working day of the year.

The manufacturers attribute the splendid showing to the extensive advertising campaign carried on during the past few years on behalf of the red cedar shingle, which has tended to widen the popularity of this class of roofing. The shingle has been able to withstand

competition, and its merits have been widely proclaimed through well-directed means of publicity.

The value of the total production in 1917 was \$7,609,834, of which \$5,182,856 was the value of shingles shipped to the United States and \$2,426,998 shipments within the Dominion. In 1916 the production was 1,900,000 thousand shingles, and last year this was increased to 2,278,205 thousand. Shingles were exported to the United States, according to United States consular reports, as follows:

	M.	Value.
First quarter	265,991	\$ 856,926
Second quarter	408,958	1,533,390
Third quarter	314,066	1,172,084
Fourth quarter	422,405	1,620,456
Totals	1,411,420	\$5,182,856

There were about 340 machines in the province, 20 per cent. operating day and night, the balance in days only. The shingles found a very ready sale in the United States and Canada, principally on account of the fact that the farmers have been enjoying exceptional years of prosperity and used large quantities of shingles for building. As yet manufacturer have not been able to make any satisfactory estimate of 1918 business, conditions being very unsettled in so far as they affect shingle production.

Lumber Company Has Fine New Quarters

The handsome new office building of the Fraser Company, Ltd., in Edmundstun, N.B., which is one of the most attractive and complete structures in the province, is now occupied by the company. The edifice is constructed of brick and concrete, and presents a very substantial and imposing appearance. The dimensions of the spacious office are 40 x 70, two storeys and a basement. The basement, which is to be used as a recreation and billiard room for the employees, is well lighted and airy, having 13-foot ceilings. The first floor includes the filing rooms, general offices, stenographers, accountants, and public waiting room and vaults; also a telephone booth with switchboard. The second floor contains the offices of the general manager, purchasing department, selling department, traffic, woods department, operating department, stenographers' room, and filing vault. The building is lighted with an X-ray indirect system. The interior is finished in native pine, natural finish, cut at the company's sawmills, Plaster Rock, and prepared by the Woodstock Wood Working Company, who did all the factory work connected with the building. The floors are polished brick throughout.

Building New Coasting Vessel

With the advent of spring, shipbuilding yards in Nova Scotia are getting busy. A new coasting steamer is being built at Wedgeport, and the craft was recently launched. The vessel will be put afloat early in April. She is 150 feet over all and upwards of 400 tons capacity. This new coasting steamer will receive her machinery at Yarmouth. Work on another and larger vessel will shortly be started at Wedgeport. A great proportion of the material is already milled and on hand. Her length will be 165 feet over all and capacity 600 tons. The Milton Shipbuilding Company have commenced operations in their yard in Yarmouth, where a machine and tool shop is being erected. The keel of a new vessel has been cut and shaped at Lake Annis and has arrived in Yarmouth.

Shipbuilding in the Ancient Capital

The revival of wooden shipbuilding in Quebec is one of the outstanding features of the great war, and its rejuvenation in the ancient capital has been the means of affording several hundred Quebec men with well-paid work during the past winter. Not only has it afforded a considerable amount of employment, but it illustrates among other things the fact that the art of wooden shipbuilding has not been entirely wiped out by its gigantic successor, the steel shipworks, although many tools hitherto almost exclusively employed on steel are now helping to make the wooden ship the pronounced success it undoubtedly is. The Quebec Shipbuilding and Repair Company has secured the services of one of the best shipbuilders in Eastern Canada, in the person of D. McLaughlin, of St. John, N.B. He had already built the large 1,500-ton four-masted schooner "M. P. Connelly," now fitting out for her first voyage, in the Louise Basin. He was also the builder of the three-masted schooner "Valkyrie," which made such a stir at the time by her fast passage from the River Plate to New York in 37 days. The barque "Sayer," which completed her voyage from St. John, N.B., to Liverpool in 20 days, too, was the product of his master hand.

R. L. Clark, Montreal, Eastern salesman for Edward Clark & Sons, Ltd., Toronto, has been confined to his room by illness for some time, but is now making good progress toward recovery.

Completes Contract for Any Building

How Georgetown Man, Who Started as a Carpenter
Has Developed Live Trade in Two Towns

"I draw my own plans and contract for the completion of a building, although I am not doing as much of the latter now as formerly, owing to the scarcity of labor. For many years I have prepared plans and estimates for any class of structure," remarked J. B. Mackenzie, who conducts retail lumber yards in Georgetown and Acton, Ont., and in both of these towns owns busy planing mills. His head office is at Georgetown.

The story of how Mr. Mackenzie "evolved" into his present activities is rather an interesting one. After spending his boyhood days on a farm in Esquesing Township, where he was born, in 1876, he learned the carpentering trade and then branched out into the contracting line. He always did a good job, and his customers had implicit confidence in him.

Mr. Mackenzie's business grew to such an extent that he began handling small stocks of lumber, and this eventually led him to establish a planing mill in Acton eighteen years ago. Nine years later he acquired the Georgetown plant from H. P. Lawson, of Georgetown, who had operated it since 1897. The latter mill is a splendid structure, of solid stone, 60 x 80 feet, and is equipped on the ground floor with a surface planer, rip-saw, four-sided sticker, buzz planer, variety saw, and re-saw. On the second floor is the sash and door machinery. The product of the plant is planed lumber for the trade and for local sale, and all kinds of doors, sash, mouldings, and interior fittings for banks, stores, and offices. The motive power used is hydro-electric, and a large dry kiln, capable of holding 20,000 feet, prepares the lumber for use. Mr. Mackenzie carries at Georgetown a stock of about \$15,000 worth of lumber in the yards and mill ready for use. He secures his supplies as far north as New Liskeard, as far east as New Brunswick, and from across the boundary line as far south as Louisiana.

Numerous attractive dwellings have been erected by Mr. Mackenzie,

J. B. Mackenzie, Georgetown, Ont.

Mr. Mackenzie's plant at Georgetown, Ont.

Mr. Mackenzie, who is an enterprising and public-spirited citizen, and his contract work during a busy season has always reached large proportions. Sydney Young is manager of the Georgetown mill and R. J. Waldie is manager of the contracting department. Both have been with Mr. Mackenzie for many years, and the result is an aggressive and prosperous business. Mr. Mackenzie is an enthusiastic member of the Ontario Retail Lumber Dealers' Association.

During the nine months ending December the quantity of lumber shipped through the Canadian and United States Sault Ste. Marie Canals amounted to the following: 1917, 350,609,000 feet; 1916, 341,352,000 feet. The great majority of these shipments passed through the United States canal.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch). \$2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Wood and Sawdust Wanted

100 cars slabs and sawdust for spot cash soon as loaded. Address Box 676, Canada Lumberman, Toronto. 4-7

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Basswood Wanted

Highest cash price paid for log run basswood and mill culls. Also other hardwoods of all kinds. Address Box 712, Canada Lumberman, Toronto. 7-10

WANTED—One car of 3 in. No. 1 and Clear Spruce; two cars of 2 in., also some 1 in., 1½ in. Will take it green or dry.

EDWARD C. BRADLEY,
Gerke Building,

5-6-7-8 Cincinnati, Ohio.

Maple, Birch, Etc., Wanted

We are in the market for Maple, Birch, Elm and Basswood, to be sawn to our order. Spot cash settlements and assistance given to responsible parties.

Address Box 702, Canada Lumberman, Toronto. 6-t.f.

Birch Logs Wanted

Wanted—Prime No. 1 Birch Logs for rotary cutting, 16 in. diameter and up. State price, earliest delivery. Box 675, Canada Lumberman, Toronto. 4-7

For Sale-Lumber

White Oak Hearts

We will be sawing a quantity of White Oak that would furnish squared hearts, 4 in. x 4 in., 8 feet long.

Address enquiries to Niagara & Erie Land Corporation, Lynedoch, Ontario. 7-10

Lumber For Sale

Two cars 4 x 4 Maple Boxed Hearts.
One car 5 x 5 Maple Boxed Hearts.
One car 6 x 6 Maple Boxed Hearts.
Seven cars Fir Doors.
Three cars Fir Columns.

GEO. C. GOODFELLOW,

Montreal, Que. 7-8

Lumber For Sale

1 Car Square Spruce, 16 ft. and up, 7 x 7 in. and up to 12 x 12 in.
1 Car Square Cedar, 8 ft. long, 4 x 4 in. and 5 x 5 in.

About 400 M. ft. Mill Run Spruce, Culls out, 1, 2 3 x 4 in. and up, and 4 x 4 in. and up, to 9 x 9 in. Also a few carloads of pulpwood, all for immediate shipment.

Timber Limits For Sale

FOR SALE—The actual owners wish to get into touch with actual buyers. Virgin timber; average 27 M. to the acre; on a river; close to tire water; inside Vancouver Island. Fir, spruce, yellow cedar, red cedar, Coast hemlock, balsam. Exceptionally good logging. Held under perpetual licenses. Price on basis of one dollar per M. Address: The Sunset Mills, Limited, Nelson, British Columbia. 6-10

TOWNSHIP OF FOSTER

36 square miles splendid body mixed timber; pine, hemlock, birch, spruce, elm, ash, maple, pulpwood, cedar poles and ties, cordwood. Roads cut, streams improved. One of cheapest operations on North Shore. Supplies landed on limit from Algoma Eastern Railway and C. P. R. within hauling distance. Ideal portable mill operation. Suitable for furniture manufacturers. Cheap railway rate to Little Current for water shipment. No time limit for cutting all classes of timber. Apply, R. B., Box 682, Canada Lumberman, Toronto. 4-8

Fine Walnut Grove Sold

According to advices from Chillicothe, Mo., loggers in the employ of a gunstock company began work at that point recently clearing the walnut from the Howdshell forest, south of Excelsior Springs. This forest contains what is said to be one of the biggest, if not the biggest, walnut trees in the United States. It measures seven feet in diameter, is forty feet to the first limb, and forty-eight inches in diameter at the first limb. R. L. Odell, who negotiated the purchase of the timber for the company, estimates this tree to be valued at about \$2,000. The gunstock company is under contract to furnish gunstocks for the United States Gov-

ernment. This walnut grove has been one of the prize tracts for several years past, and only recently has been placed on the market. It has been in possession of the Howdshell family for about 100 years. The present owners are the Misses Amanda and Martha Howdshell. They were born and reared on the place, and the forest of almost 500 acres has been held by the family largely as a matter of sentiment up to this time. The women decided to part with the property only when they became convinced that it was their patriotic duty to place the timber at the disposal of the United States Government and its allies.

Review of Current Trade Conditions

Ontario

The situation that has developed during the past two weeks is somewhat interesting, and the principal themes of discussion at present, where members of the trade congregate, are the prices being asked for the 1918 cut in both hard and soft woods. In not a few instances the advances over the corresponding quotations of last year run all the way from 35 to 75 per cent. While some sales of the season's cut have been made, the tendency is for wholesalers to sit tight at present and await developments. The manufacturers, however, declare they are not experiencing any uneasiness, as they realize that the market is a seller's one rather than a buyer's. If present prices are maintained throughout the year there is no fear but that the cut could be handled satisfactorily, even at the advances which have been put into effect. The conditions over in Europe are in such an unsatisfactory state and the outcome so doubtful that many think the war may suddenly collapse, in which case the wholesaler might find himself in a serious predicament. If a demand is maintained there is little fear but that present prices will hold, but stocks, in many instances, are low, and it is a question whether the demand is sufficiently insistent for the consumer to pay the constantly increasing charges that are being passed on him owing to the shortage of labor, the recent increase in freight rates, and the higher wages that are bound to prevail in the mills. It is reported that there is a scarcity of help in some centres. There is not much to be said on the car situation, which is materially improved, although in some districts it is bad enough yet. Generally speaking, lumber companies are being afforded better facilities than was at all possible a few weeks ago. Even to United States points the movement of lumber is being speeded up.

There is no doubt that British Columbia products of all kinds—spruce, hemlock, cedar, and fir—will command a very much higher price in the East, not only by the reason of the jump in freight rates, but also as an advance has gone into effect through the shorter working hours in the West. It is estimated that, by reason of this, the increased cost of production in both logging and mill operations will be from 15 to 25 per cent. The loggers are now working on an eight-hour day basis. Logs have also advanced considerably in price. British Columbia mills are now operating on a 49-hour week basis instead of 59, as formerly, all plants shutting down at 12 o'clock noon each Saturday. All this, of course, adds much to the expense of production. Prices have been revised, but it is not possible to intimate what the advance is. Before definite quotations are given it will be necessary to take into consideration the increase in the present 67-cent freight rate.

There are a large number of enquiries for dry basswood. Building operations as yet do not appear to be very promising, but in many places, particularly in Western Ontario, activity does not develop until late in the spring.

Eastern Canada

Business is picking up in the lumber line, and it is expected that, with the resumption of the mills this month, a very fair season will be in prospect, in spite of several handicaps. There has been a great improvement in the car situation, and domestic shipments are now made with but few delays. The shipments across the border, however, are still interrupted in many instances, owing to the inability to obtain United States cars. However, after many weeks of delay and vexation, wholesalers and manufacturers welcome any relief in the distribution problem. There is no doubt that higher prices are going to prevail throughout the whole season, not only owing to the increase in freight rates, advance in wages, but augmented cost of production generally. Negotiations are now going on between wholesalers and manufacturers for the purchase of 1918 cut, but not many bids have been closed so far as wholesalers do not seem anxious to take aboard any large stocks at the present exalted values. The desire is to hold off a while in order to ascertain how matters are shaping up. In case there should be an abnormal demand for lumber there is certainly not enough stock to go around. It is announced that the late snows and cold weather will delay the starting up of some of the sawmills in New Brunswick. A few plants have no logs yet, and, therefore, cannot begin. There is no activity in English deal sales, and whether shipping facilities will improve is a matter of conjecture. The outlook at present for shipments to the United Kingdom is not very bright.

In the East it is reported that there have been some sales of timber by wholesalers to government contractors at high figures. With the arrival of spring it is believed that business will be on a fair basis,

although it is too early yet to judge of the effect on the trade in general.

Writing to the "Canada Lumberman," a widely-known exporter of Quebec City says that there is little doing in the export trade at the present time, owing to the embargo on the import of wood goods into the United Kingdom, consequent on war conditions. This has reduced exporting almost to the vanishing point, except for British Government requirements.

United States

The demand for hardwood continues strong, and if the manufacturers are able to cut all the logs to fit the demand there will be no difficulty in disposing of all the lumber produced. Taking the situation as a whole, the call for hardwoods is excellent, and sufficiently large to provide manufacturers in the East, North and South with abundance of business.

With the advent of warmer weather the car situation has improved materially. Conditions in some centres are spotty and the demand spasmodic. In several lines the mills have more business than they can handle. Many of the embargoes have been lifted, and things are generally assuming a steadier tone.

There has been an increased demand for white pine, while in the East the supply of spruce continues to be less than the requisitions. Manufacturers predict that production will be less this year than ever, owing to the cut of logs during the winter being unusually small and labor exceptionally scarce. Hemlock is enjoying a fair share of the business that is going, particularly in the East. The demand has kept up well, and the tendency of the market is upwards. It is reported that the car situation on the Pacific Coast is still very acute, and shingle manufacturers have felt the effect keenly. A number have been forced to close down owing to the lack of cars in which to make shipment. The trend of the shingle market is decidedly upwards. As a whole, the demand for red cedar shingles is better now than it has been for some time. One of the difficulties that is facing the producers of Douglas fir is in disposing of the side lumber resulting from the manufacture of the best of the logs into airplane and ship stock. Just so much and no more lumber can be stacked in a yard, and some of the yards are approaching the limit. This is not because the lumber cannot be sold, but because not sufficient cars are available in which to make shipment. The government realizes the situation and is making plans to help, but the plans may come too late to prevent some mills from shutting down by the government officials. The questions arising from the eight-hour day are slowly being worked out, but it will be some time before the actual results can be obtained. In comparing the production of the same 122 mills for the weeks ended March 2 and March 9 the West Coast Lumbermen's Association shows that, while production was decreased by the eight-hour day, the decrease will probably be considerably less than 20 per cent. The week ended March 2 was composed of four working days of ten hours and two working days of eight hours. Production for the week ended March 9, when compared with that of the preceding week, showed a decrease of 9.86 per cent. for 122 identical mills. Thus on this basis production would be slightly more than 13 per cent. less for a full eight-hour day week when compared with a full ten-hour day week. Naturally, the price situation is quite firm, and there has been some marking up of quotations to take care of the increased cost resulting from the eight-hour day. Not much eight-hour lumber is on the market yet, however, and the price situation is certain to remain firm.

Great Britain

In normal times timber importers were, at this season, usually making plans for the opening of the timber importing season and fixing up contracts for f.o.w. shipments, and shippers and their agents had pretty well sounded the trade generally and got some guide as to the prospects of the year's ordinary demands. No such activity is noticeable in these times, beyond a few stock lists coming to hand, with heavy prices in most cases attached, figures being quoted that almost puts the importer out of the running if he keeps within the regulation maximum prices he can sell at. Reports from Liverpool say that excepting a few transactions which have further depleted yarded stocks business in imported softwoods shows slight improvement. The import has been negligible so far as the market is concerned, a condition which accounts mainly for the absence of activity. As regards future trading, unfortunately nothing encouraging can be gathered. The same uncertainty exists as heretofore in regard to ship-

ments from Canada. The tonnage factor governs the issue, and fresh information concerning the possibilities of obtaining ship-room for the carriage of woods goods is unobtainable. Until this information is vouchsafed importers will be in the dark as to their future trading prospects.

From the general position of shipping at this crisis in the country's history it would not be wise to assume that any considerable allocation of freight space will be granted for wood transportation, unless, of course, a change in the war brings about an unforeseen situation involving the release of tonnage which could be utilized for other than direct national requirements. In such a case the paramount necessity of safeguarding the timber supplied would obviously be one of the chief considerations in deciding how such released ships should best be used commercially.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Increased Demand--Shortage of Labor

Ottawa, March 26.—(Special to the "Canada Lumberman.")—Advanced prices and an increased demand, coupled with growing unsettled conditions for transportation and labor, were the principal happenings in the Ottawa lumber market during the closing fortnight of March. The month generally brought its expected increase in demand for both export and domestic stocks, but the improvement in the transportation situation that was looked and hoped for did not actually materialize.

Prices, mostly on second-grade pine, advanced from \$2 to \$10 per M. Hemlock 1 in. log run and 1 in. cull advanced from \$2 to \$9 per M., and likewise tamarac. So far as prices were concerned, the market had a rock bottom. Though the most recent advance looks big, there was nothing to indicate that prices would not ascend again before the summer months. The correspondent of the "Canada Lumberman" heard from one source that the increase in manufacturers' prices for the 1918 sawing would run in the neighborhood of 30 per cent. above last year's quotations. Prices for lath declined.

The car situation, despite prevailing open weather, did not show much, if any, improvement as compared with the opening period of the month. Foreign cars for shipments to the United States remained decidedly scarce, and cars for domestic shipments were not plentiful. Rough lumber was being shipped in coal cars to the United States. The intermittent lifting and applying of embargoes at American points continued, and shippers began to look on them as an ever-present affliction that had to be endured.

Besides the car and embargo situation, to which the shipper has got pretty well hardened, is the outlook for mill labor this summer. In the minds of many during the last week of March this was the most unsettled and disturbing element. Previously the shippers reasoned: "What's the use of booking orders if you cannot get cars for shipment?" Now the wind has veered to "What's the use of getting cars if you cannot get labor to make lumber to fill them?" So serious is the outlook toward the labor situation that it is a big question with some of the mills if their 1918 sawmill cut will not fall below that of last season, even though the logs are almost on hand to convert into lumber. July and August, when the Western harvest is being garnered, it is feared by the lumbermen, will likely be the two worst months of the year.

Wages for mill labor in the Ottawa Valley mills are almost certain to advance this summer. It is forecasted that it will not be a question of paying the wages demanded, but of getting the labor to operate the sawmills. Most woodworking plants are already expressing apprehension as to the labor situation. The usual early spring unrest among employees was much more noticeable this year than last or other seasons. When the sawmills start up the woodworking plants fear that a considerable portion of their labor will forsake them and drift to the manufacturers' plants. The sawmills will have to pay higher wages to get workmen this year than they did last.

Even with advanced wages, millmen are skeptical if the same number of men will turn out as much product in a given time as in former years. The lumber heads in the Ottawa district agree that experience has shown that higher wages to workmen have been productive of decreased effort and output on the part of the employee. A. M. Davis, of McAuliffe-Davis, says it costs four times as much to unload a car of lumber to-day as it did five years ago. The workmen do half the work they used to do and take twice as long to do it. Enlistments and high wages in munition plants and other lines of industry are chiefly responsible for the shortage of mill help.

In connection with the transportation problem lumbermen have

The landed stocks of mahogany at the docks are slowly but surely dwindling away, and a few more weeks will see them down to under a couple of thousand logs, and these, for the most part, not such as brokers would describe as sizeable. The last week's deliveries show some improvement, particularly in regard to Honduras wood, which description is the only one of which the stock runs into four figures.

For cedar nowadays there seems to be no use, and the stock on hand at the docks only totals 22 logs. For a long time past, even so long ago as before the war, the arrivals were few and far between, although there was always keen competition for any reasonable good wood that came to hand. On account of its lightness and other good qualities, service requirements might well call for the use of more cedar, but the demand does not appear to run just now in that, or, for the matter of that, any other direction.

hope for relief when navigation opens. Two avenues seem possible. One is the shipment of lumber on Canadian barges to American frontier ports and the other the operation of barges on American canals, which will relieve freight traffic over rail in the United States and likely permit a great number of foreign cars to become available for shipment from Canada.

The market is not overstocked, and some grades are running short, including mill culls, dead culls, and marketable spruce and marketable red pine and culls. Stocks of box spruce were practically cleaned up, but most of the plants having shell box orders on hand have enough in sight to carry them through with present orders. If new orders are forthcoming, it is expected that the 1918 mill cut will have to be tapped and kiln-drying used to get the stocks in shape for shell box use.

Though building grades remained quiet the outlook is better than a year ago. Much lumber will be required for the new buildings on Sparks Street to replace the fire-swept Arcade, the new government building on O'Connor Street, and some other projects which it is announced are to be proceeded with.

Mr. Grant Davidson, head of Estate of James Davidson, looks for a critical labor situation. Unrest, he reports, developed during the latter part of March with mill employees, with the result that they were coming and going all the time. The plant completed its 128,000 shell box order around March 28. Millwrights are busy effecting repairs at the sawmill at Fort Cologne, and it is expected that sawing will commence April 25. The cut of the mill will be about the same as last year, 80 per cent. of it being pine. The sash and door trade remained slow, and there was little or no demand for building material.

The McAuliffe-Davis Lumber Company reported business as having showed little change as compared with the previous three weeks. Foreign cars for shipment of dressed lumber were badly needed, but were almost entirely unobtainable. Mr. A. M. Davis reports that, while the building trades are quiet just at present, the outlook is much better than a year ago. He anticipates that unrest will arise among mill labor, and that wages for this class of labor will advance this summer.

Orders for export trade were very numerous with Shepard & Morse. The chief difficulty was the shortage of foreign cars. Many shipments were delayed. The demand for domestic business was reported as being good and was better than for a corresponding period last year. Mr. P. C. Walker anticipated a considerable scarcity of sawmill labor, which he believed would lessen the production. To offset the shortage of labor, Mr. Walker said that the government should conscript foreign labor and make it work. About 30 employees of the Shepard & Morse mill have gone to the front. Several of them enlisted under the voluntary system.

Gilmour & Co. report the market very firm and stocks short. Orders and enquiries continued good. Speaking of the transportation situation, Mr. Gilmour said he believed that the inability to forward shipments was not so much, in his mind, to the car situation as for lack of locomotives. Several of his shipments already loaded had been placed on sidings, and were not moved for days. He looked to the opening of navigation to help out the transportation situation.

Fraser, Bryson Lumber Company say that orders are keeping up good, the principal demand being for export to the United States. The spruce market with this company was active. The market, they report, is not overstocked. Like the other lumber companies, shortage of cars is considerably hindering shipments. The domestic demand is reported as being fairly good.

The outlook toward general lumbering conditions with John R. Booth are none too bright. Jackson Booth reports the lack of cars and

The Only Milk You Need in the Camp

Klim supplies all milk needs for Lumber Camps—and saves money, transportation charges, storage room and labor.

Klim is pasteurized, separated milk in powder form. It is made by separating the butter fat from pure Ontario milk and reducing the remaining body-building food value, casein, albumen, milk sugar and salts of milk to powder form by removing the 87½ per cent. water content of the original milk.

When dissolved in water according to directions, it makes a liquid with the natural milk taste.

Klim is a Wartime Economy.

Klim is economical. It costs less per gallon than any other form of milk. It bulks small—weighs light—saves 50 per cent. to 75 per cent. of freight bills on your milk supply. It keeps sweet and fresh until all used. There is no spoiling and wasting through changes in temperature.

In a word—Klim is pure, wholesome, convenient and economical. Use it and save money.

It is "the regular milk" used daily in the Lumber Camps of Canada. Your cooks probably know Klim. Add it to your list of supplies.

embargoes are seriously delaying many shipments. "For once the manufacturers are afraid of what is going to happen, and cannot with certainty judge the situation. I think they are all in the same boat regarding labor, and it is still a question with them whether they will be able to operate at all or not," he stated.

J. Oliver & Sons report that the general advance on all lines of furniture will be about 15 per cent., due to increased cost of labor and stock. The demand for furniture was reported as being very good. Good progress was made on the shell box order, which it is expected will keep the plant busy till around May 15.

Orders and enquiries continued good with W. C. Edwards, but shipments, both domestic and foreign, were greatly hampered by lack of cars. Good progress was made on the shell box orders. "Business has been very good, indeed. It is simply a matter of making shipments," said Mr. Gordon Edwards.

The M. C. Neate Lumber Company, Ltd., reported business keeping up good and their shipments hampered through lack of cars, for both domestic and foreign business. The domestic car situation is reported improved somewhat over the opening period of March.

General Conditions Picking Up

Montreal, March 28 (Special to the "Canada Lumberman") :—Business has picked up somewhat. The better weather has enabled building to proceed at a faster pace, although the prospects for a substantial programme are not rosy. The car situation, so far as domestic trade is concerned, has improved, but there is still much congestion of shipments going over the border. It is reported that many foreign cars are being held at the disposal of the pulp companies and of those sending pulpwood, to relieve what is described as a famine in certain classes of paper in the United States. A lot more lumber could be delivered if the cars were available.

The demand in the province is said to be larger, due to more activity in the contracting business.

Inquiries for hardwoods are good, particularly basswood and birch logs.

Although the buying of British Columbia lumber for shipbuilding has generally slackened, and prices are inclined to be easier, the orders from the East have shown a slight improvement.

As regards prices for the new cut, most wholesalers spoken to are looking for an advance in the region of \$10 per 1,000 feet, with a tendency to still further stiffen as the season proceeds. All are agreed that we are in for a period of high prices, based on the heavy cost of production.

The outlook for export to the United Kingdom is not hopeful. While it is too early to speak definitely, the prospect is, that no space will be available for ordinary business, the entire space having been taken over by the government. Exporters, however are buying considerable amounts of lumber.

The Situation is Brightening

St. John, N.B., March 27 (Special to the "Canada Lumberman") : The past two weeks have seen a slight change for the better. While no alteration has come in prices, there are many American buyers or their agents on the market, who have travelled the east. They have assured themselves of the great shortage in the log cut, during the past winter, and say that without doubt there will not be enough lumber to go around, should there be any demand at all. On the head of this information they are disposed to buy, and offers have been made, but not at prices which the manufacturer feels disposed to sell his cut of 1918. Should the government need any material—and it certainly will—only a few mills have full stocks to fill orders. Certainly the government will not expect the manufacturer to produce at a loss, and will protect him in a fair profit.

The question of costs of production and handling is being gone into thoroughly and large increases have taken place—far more than anticipated. A certain amount of deals are finding space on the transports, and deliveries are slightly better than a month ago. If the American railroads would only supply cars due for the east more stock could be shipped. Up to the present time the quota of American cars coming east has not been up to normal. Many of the Canadian cars are in American territory, and, it is understood, that the proportion of Canadian cars held on United States roads is greater than the proportion of American cars on Canadian lines.

No English deal sales have yet materialized, as buyers cannot evidently get a guarantee of deliveries. Should any opportunity open for deliveries it is certain to find the producer unprepared for want of material.

The late snows and cold weather will cause at least two weeks' delay in the opening of the sawmills at St. John. Some have no logs, and therefore cannot start early; but others are ready and only awaiting the opening of mill ponds to begin work.

Local or factory business shows no improvement. If warm

weather—which is now overdue, appears, no doubt the usual spring work will start up and will give the factories a certain amount of small work.

There is absolutely no low grade stock at St. John, and very high prices are being offered by box mills for it.

Have Doubled Box Factory Capacity

The Keewatin Lumber Company, of Keewatin, Ont., recently increased their box factory capacity and have doubled their output by installing some machinery in the plant recently taken over by them from the Rat Portage Lumber Company, at Kenora. This will give the Keewatin Company a cutting-up capacity of about six or seven million feet per annum. D. McLeod, manager, states that it is difficult to estimate lumber requirements in their territory this year. Business is not very regular, and it is almost impossible to figure just what will be required. Stocks are low and badly broken. The log crop will not be quite as large as in previous years. "We expect," added Mr. Leod, "that there will be a good demand for all that we are able to produce, and it will probably be sold at prices which, on the average, will be considerably better than last year. The advance in price has, however, been more than offset by the additional cost of production.

The Storage Battery Locomotive

The Jeffrey Manufacturing Company, of Columbus, Ohio, have recently issued a handsomely illustrated catalogue on Jeffrey storage battery locomotives for lumber yards, contractors, and industrial plants. The firm state that one unskilled laborer and a Jeffrey storage battery locomotive will do the work of many men and trucks, and will handle materials faster and at less expense and with less trouble and supervision. The locomotives are built for heavy service, the frames being constructed of structural steel, reinforced with cast steel journal pedestals, their rugged strength ensuring low cost of upkeep. The flexibility of the track system used and the freedom from fire hazards from hot sparks and cinders, backfires and exhaust gases, permits it to go anywhere about an industrial plant with absolute safety. The new catalogue contains descriptions of various installations and information regarding details, as well as useful data for users of storage battery locomotives. A copy will be sent to anyone interested by writing to the Jeffrey Manufacturing Company, Power Building, Montreal.

Lumber License Can be Seized

An interesting case was recently heard at Vancouver, before Chief Justice Hunter, who held that a timber license meant an interest in land. He accordingly made an order in the case of the Royal Bank against the Yellowhead Pass Lumber Company for the sale of a certain timber license which the lumber company held. The action was tried some time ago, when judgment was secured and the recent application was to recover the judgment by the sale of certain chattels and the license. Counsel for the Royal Bank contended that the timber license had been held to be an interest in the land, while the Yellowhead Pass Lumber Company unsuccessfully argued that a license could not be sold, and submitted that the only way it could be dealt with was to get the approval of the crown. The contention was also put up that a license was not real property and, therefore, could not be seized. The court, however, held otherwise, and timber rights can be dealt with in a sale the same as any chattel.

Will Women Do Forestry Patrol Work?

Writing to the press, a correspondent who signs himself "Lumberjack" says that women are taking the place of men in all lines and branches of work, and it is wonderful the success with which they have met. Men are very scarce, and this coming summer will be more so. "I wonder," he asks, "how the Ontario Government will get men to do the work of fire rangers? The government has to patrol miles of railroad besides the forests. Of course, women could not do the forest work, for the men have to carry all their provisions and their canoes over the portages and to cut portages and find new routes and rough it generally. Perhaps women could do the railroad patrol work, and thus leave hundreds of males free for the other and rougher and heavier work. Patrolling the railroads is healthy, and it would be a change. What do the women think about it?"

Nova Scotia Shipbuilding Active

At the present time there are about thirty vessels being built from Hantsport to Yarmouth, as follows: Hantsport, 2; Bridgetown, 1; Annapolis, 2; Port Gilbert, 1; Weymouth, 2; Beliveau Cove, 3; Grosses Coques, 1; Church Point, 1; Little Brook, 2; Saulnierville, 1; Mategan River, 4; Salmon River, 1; Yarmouth, 2.

Besides this, five more are expected to be built at Hantsport and one more at Weymouth. These vessels range from 250 to 400 tons.

CANADIAN WOOD PULP

**We are the
LARGEST
BRITISH
IMPORTERS
of Canadian
WOOD
PULP**

Canadian Wood Pulp is in great demand to-day, and every timber man should take advantage of the opportunity to add this profit to his business. A small Kraft Soda Mill is inexpensive, and will handle all the wood waste, slabs, bottoms, tops, etc., around the mill or yard. You can dispose of any quantity at good prices, or on long-term contracts, if desired. The previous sources of supply for the business have been cut off almost entirely, and Canadian business men can reap the benefit with little risk or investment.

New Stop-Off Rates Opposed

Railways Propose to Double the Tariff and Cut Down Certain Privileges—Conference Held

An important conference was held in Toronto recently between the representatives of the Canadian railways and lumber manufacturers and wholesalers in regard to the stop-off service. Some time ago A. E. Eckardt, of the R. Laidlaw Lumber Company, Toronto, wrote the Canadian Railway Commission for an interpretation of a clause in regard to minimum weight of lumber carried in a car. He was requested to appear before the commission, and in connection therewith the railway companies brought up the matter of revising their tariff on stop-off and re-shipping privileges and increasing the rates.

It was suggested by the commission that a conference be held between the lumbermen and the railway companies to see if an adjustment could not be effected.

It has been the practice for the companies in the past to give shippers the benefit of a through rate, on carload lots, from the original shipping point to final destination, in connection with the stop-off service, plus 1 cent per 100 pounds, with a minimum of \$5. It is proposed to raise this to 2 cents per 100 pounds, with a minimum of \$8. In other words, the freight tariff on the stop-over service would be doubled.

In addition, it is proposed to limit the charges for the stop-off arrangement to planing, re-sawing, and sorting, and eliminate tongued and grooved, siding and kiln-drying, which privileges have heretofore been enjoyed. The latter are to be removed to a higher classification and the rate increased.

The railway representatives contended that they were not getting a high enough rate for the stop-off service, owing to the increased cost of handling, switching, operating expenses, etc.

The arguments put forth by the lumbermen were that the service which had been furnished during the past season was not up to the mark, and that a general increase of 15 per cent. in freight and passenger rates had already gone into effect, which, it was maintained, was sufficient to cover any extra outlay on the part of the roads.

The whole situation was thoroughly discussed and many points brought out. Some concessions were proffered by the railways in connection with foreign carload shipments, if the proposed rate on stop-over service was allowed to go into effect.

It is understood that no adjustment was arrived at, and the question still remains an open one. If an amicable agreement cannot be reached, in all likelihood the whole matter will come before the Canadian Railway Commission at an early date for hearing and decision.

Among those at the conference were C. E. Dewey, freight traffic manager, G.T.R., Montreal; L. MacDonald, district freight agent, G.T.R., Toronto; H. E. MacDonell, assistant freight traffic manager, C.P.R., Montreal; P. Mooney, assistant general freight agent, C.N.R., Toronto; J. E. Walsh, Toronto, manager of the transportation department of the Canadian Manufacturers' Association; T. Marshall, Toronto, manager of the traffic department of the Board of Trade; S. C. Thompson, of the W. C. Edwards Company, Ottawa; Frank Hawkins, secretary of the Canadian Lumbermen's Association, Ottawa; A. H. Campbell, of Campbell-McLaurin Lumber Company, Montreal; A. Gravel, of the A. Gravel Lumber Company, Etchemin Bridge, Que.; A. E. Eckardt, of the R. Laidlaw Lumber Company, Toronto; Guy H. Long, of the Long Lumber Company, Hamilton; A. E. Eckardt, of the R. Laidlaw Lumber Company, Toronto; W. E. Bigwood, of the Canadian General Lumber Company, Toronto; H. A. Leak, of Leak & Co., Toronto; Duke Johnston, of the Union Lumber Company, Toronto; J. G. Cane, of J. G. Cane & Co., Toronto; Alex. Read, of Read Brothers, Toronto; W. B. Tennant, of J. B. Smith & Sons, Toronto; A. E. Gordon, of Terry & Gordon, Toronto, and others.

Budget of Briefs from Ottawa

Ottawa, March 25.—(Special to the "Canada Lumberman.")—Ottawa's civic wood fuel yard began operations during the latter part of March. The price set was \$12.50 per cord, delivered at the home of the purchaser and cut in length from three to four feet. Deliveries of the wood contracted for arrived quickly, and the city is attempting to find immediate sale for it, to avoid piling in civic wood yards. It has been suggested that four sites in different parts of the city be provided for piling purposes.

Major Kenneth McDougall, of Ottawa, has been awarded the Distinguished Service Order for specially efficient and notable service in connection with the Canadian Forestry Corps. He went overseas in 1916 as a lieutenant in the first forestry unit.

During the recent Patriotic Fund and Red Cross campaign at Ottawa John R. Booth subscribed \$25,000 and the employees of his plant \$1,725.70. The Rideau Lumber Company subscribed \$1,000, and C. Jackson Booth and J. Fred Booth \$2,500 each.

An order which may ultimately work to the advantage of the lumbering trade in the facilitating of domestic shipments was recently placed by Hon. J. D. Reid, Minister of Railways, for 100,000 tons of

rails with the Dominion Iron and Steel Company. Ten thousand tons are to be supplied in April. The orders are for heavy rails, which are to be used on the main lines.

An insight into the acute car situation in the Ottawa Valley was instanced during the latter period of March, when the Grand Trunk said it could place from six to eight hundred cars on the Ottawa division and have them loaded in forty-eight hours. One lumber company is reported to be 1,200 cars behind. Though all shippers suffered more or less, the lumbering companies fared worst of all. Preference was given by the railways to shipments of fuel, munitions, and food. The New York and Ottawa road depended entirely on cars sent to Canada from American points.

Opinions as to the existing shortage differ as to the reason for the lack of transportation facilities. Some believe it is a shortage of railway cars, others a shortage of locomotives, and still others blame the existing government orders in the United States and Canada. Besides having to secure a permit for import to the United States, it has been heard that the American Government in some cases also stipulates what cargo a car entering Canada shall bring back. Thus if foreign cars in Canada are stipulated to bring back a certain cargo they are not available for lumber shipments.

Mr. C. Jackson Booth, when asked if it were true that manufacturers were using coal cars returning empty to the United States to forward shipments of rough lumber, said: "I don't know, I'm sure. I guess the manufacturers are willing to ship in anything nowadays."

An exhibition and sale of wooden bird-houses constructed by Ottawa schoolboys recently realized \$65 for the Prisoners of War Fund.

George Hutchell, working in the sawmill and employed by John R. Booth for six years, was recently interned by the Ottawa authorities as an alien enemy. He said that he had not registered as an alien subject because unaware that he was required to do so. His father and brother have been in the same employ for years.

Private A. Skipworth, formerly an employee of John R. Booth mills, returned to Ottawa on March 23, after being severely wounded on leaving Canada with the 77th Battalion.

Newsy Happenings from the East

W. P. Lowell, a prominent lumber dealer of Calais, Maine, has been visiting in New Brunswick. To a correspondent to the "Canada Lumberman" he said that he estimates that the cut this year will be between 35 and 40 per cent. less than last year. Asked on what grounds he based his judgment, he said that reports received from all over the province and also throughout Maine, were to that effect. He attributed this to a shortage of experienced lumbermen and also to the high cost of labor. Mr. Lowell is interested in operations in Rock Gulch, near Campbellton, N.B., where extensive operations are being carried on.

Mills throughout the province, especially near St. John, are making preparations for the commencement of operations in the spring. It is said that some have already commenced moving stock in order to take care of the new cut. Logs will be available about April 15.

F. C. Kinckley, a prominent lumber operator of Bangor, Maine, was a visitor in St. John recently.

It was with no little surprise that lumbermen throughout New Brunswick learned that the Miller lumber mill, situated on the St. John River, near St. John, was being offered for sale. It is owned by H. Usher Miller, and was operated until the close of the 1917 season. It is a large mill, well equipped, and has a frontage on the main river. The property consists of twenty acres, and, in addition to the mill the adjacent lime kilns are also offered for sale. The mill was operated for more than a score of years by the late Charles Miller.

The present season is to see the passing of one of the oldest towing firms on the St. John River. D. D. Glasier & Sons have been purchased by the St. John River Log Driving Company and will in future be carried on by them. Ever since lumbering operations have been carried on in New Brunswick, D. D. Glasier & Sons, St. John, have been a big factor in the industry along the St. John River and tributaries. In addition to being actively engaged in the yearly cut they did the vast majority of towing of rafts of logs from the booms at Fredericton to St. John. Fredericton will be the headquarters for the new owners of the business. They have appointed G. L. Tapley to supervise operations at the St. John end, and he will be known as the shore captain.

Arthur H. Campbell, of the Campbell-McLaurin Lumber Company, Montreal, was in Toronto last month attending the conference between the railway companies and the lumbermen in regard to the stop-over service.

C. O. Maus, of the Hyde Lumber Company, South Bend, Ind., spent a few days recently in Toronto and other points in Ontario calling upon a number of the hardwood customers of his firm.

JEFFREY "RELIANCE" MALLEABLE DRAG CHAIN

HAS THESE SPECIAL FEATURES THAT INSURE A MAXIMUM OF SERVICE

Links made of highest grade refined malleable iron—Assembled to correct pitch—Thoroughly tested before shipment.

Jeffrey "Reliance" and other types of Chains are a recognized standard for handling Saw Dust, Refuse, Logs, Lumber and other materials in Saw Mills and Wood-Working Plants.

← Long Bearing Surface of pin inside barrel of link.

← Wide Wearing Shoe—gives greater wearing surface, increasing life of chain.

← External Lug—Increases carrying capacity and protects pin head.

← Double Keyed Pin Head—prevents pin from turning. Pins made of high grade steel.

Write for Chain Catalog and Price List No. 211-6, and let us figure on your requirements.

Canadian Woods Aid the Mines

The mines have always depended on the forest for props and beams to hold up the roof, and now, by reason of a recent discovery, the mines are indebted to the forests for a most important agent in the reduction of the ore after it is mined. The flotation process for the treatment of ores such as are found in Cobalt and similar mines in other parts of Canada has been discussed a great deal of late, because by this process even very low-grade ores can be profitably mined, while the profits from high-grade ores are naturally increased. This process demands the use of a wood oil—pine oil—produced in the Southern pine forests of the United States. The supply of Southern pine oil was so limited that it seemed likely that it would all be required for United States mines.

In this situation some of the mining companies applied to the Minister of the Interior, who, through the Forestry Branch, started the chemists of the Forest Products Laboratories of Canada at work to find whether pine oil could be produced in this country from Canadian pine trees. After working several months it was discovered not only that pine oil could be made in Canada, but also that a much less expensive oil, now being produced daily as a by-product in wood distillation, could be used successfully in the oil flotation process. Before this news was given to the mining public thorough tests were made of the different oils and oil blends in the ore dressing station of the Mines Branch at Ottawa. Thus the two branches dealing with the forests and with the mines co-operated to secure the good of both these basal extractive industries. After this the new oils were thoroughly tested in some of the big Cobalt reduction plants with entire success.

The importance of this discovery can be seen at a glance. Miners are freed from the nightmare of a famine of pine oil caused by the demands of United States plants. In time of war metal production must be kept to the highest point, and with the best will in the world toward Canada, the United States would, naturally, have to look to her own plants first. Pine oil will always be a comparatively costly commodity, since it is the product of a product—it is distilled from turpentine—while the new creosote oil is a by-product of an established Canadian forest industry, wood distillation, which is carried on to produce our supplies of wood alcohol, acetic acid, charcoal, etc.

Pine oil is produced only by an expensive process; creosote oil is thrown off, whether we want it or not, in the process of making other commodities we do require. Our wood distillation plants are daily distilling about five hundred cords of hardwood. Each cord produces about 2 2/5 gallons of creosote oil, so that, in round figures, about 1,200 gallons of the oil required by the miners is produced daily in Canada. With a little further refining, what was once a by-product for which there was little demand becomes an article with a steady and growing market.

Lumber and Pulpwood Delayed

Pulpwood and lumber constitute one of the most serious problems in transportation now facing the Railway War Board, it was announced recently by the general secretary, W. M. Neal. The situation in respect of these commodities is far more difficult than in the case of wheat, for thousands of carloads are now awaiting shipment. The reason why these are held up is indicated, Mr. Neal says, by the fact that 460 carloads have been held out of Chicago for some time now, waiting to be taken over by the American railways. If more were loaded and shipped the consignees would receive no benefit, and the result would be only to cause further congestion on the railways, and to keep cars from shippers of commodities which can be unloaded promptly. The board is planning, however, to clear up the pulp and lumber shipments this summer, beginning as soon as the unloading of those now en route becomes possible.

A Valuable Reference Volume

The fifth edition of an instructive and comprehensive book, entitled "A Manual for Northern Woodsmen," has appeared. It is a valuable contribution to practical forest literature, and, besides being helpful to the beginner in timberland work, is of much benefit and worth to the most experienced. The author is Austin Cary, formerly assistant professor of forestry in Harvard University. The "Manual" contains over 300 pages, and is issued by the Harvard University Press, Cambridge, Mass. Among the many topics treated are land surveying, map-making, log measurement, estimation of standing timber, diagrams, tables, and miscellaneous information. The book has a pocket to carry loose leaves, and a folding flap protects the outside edges, while it is small enough to fit the pocket.

P. D. Gordon, of Mason, Gordon & Company, Montreal, attended the recent meeting of the National Wholesale Lumber Dealers' Association in New York, and before his return will visit several southern pine mills.

Work of Commercial Marine Engine

Owing to the increasing cost of gasoline and scarcity of coal, owners of heavy duty commercial boats are being compelled to look for power plants that will operate successfully on the low-priced fuel oils. The steam engine possibly has had its day and apparently must take a back step in the strides of progress, because of the large space it occupies, bother with ashes, and lack of economy. The gasoline engine has proven a wonderful benefit in the field of pleasure-boat engines, but owing to the complicity in the matter of high fuel consumption, delicate adjustments of carburetor, and ignition system, it does not fulfill all the conditions required, so relief is sought by a large class of boat owners. A gasoline-kerosene engine is not a complete success for the requirements of the work boat, as it is always necessary to keep a supply of gasoline on board, which is more or less dangerous and bothersome, and then the matter of carburetor and its far-reaching effects is well known.

The solution of the problem seems to be the oil engine. At the present time there is being manufactured a type of oil engine that meets many of the requirements that are lacking in steam, gasoline, Semi-Diesel and Diesel. It is the Burnoil engine, made by the Burnoil Engine Company, of South Bend, Indiana. This type engine has been manufactured in European countries for a number of years, and has been used extensively by the fishing, towing, and working boat trade owing to its ability to operate on long voyages where it was necessary to vary the speed many times and also the ability to stand up with the minimum repairs and burn cheaper grades of fuel oil. Burnoil engines run indefinitely at low speed, as they have no hot parts susceptible to cooling or cracking, thus causing misfiring, and then they may be speeded up instantly to full load. They also eliminate the carburetor, magneto, blow-torch, and pre-heating, as they start and run on one and the same fuel; they do away entirely with gasoline. These eliminations naturally increase its value as a type of engine that meets the severe commercial service of marine conditions.

An important part of the marine heavy duty engine, especially where there is considerable towing to be done, is the reverse gear. The Burnoil engine employs an extremely rigid reverse gear, consisting of one movable compound gear between the driving and driven elements. This gear was developed and has given excellent results on the Pacific Coast. This is a large external and internal toother gear that works between the stationary drum and a driving pinion on propeller shaft. The gears are what are called internal gears, and fit within one another perfectly, which gives from three to four teeth bearing at all times and permits of extra large teeth in the gears, giving more efficiency and life to them. The propeller shaft telescopes clear through the shell of gear and gives perfect alignment. The expansion ring is reinforced in such places as to give perfect friction-bearing surface at all times. A 12 1/2 b.h.p. marine engine of this make has been running daily for over a year, without any repairs, and costing less than 1 cent per mile fuel and lubricating expense. With gasoline at about 35 cents and fuel oil a trifle over 13 cents per gallon, and also when it is considered an oil engine of this kind consumes about one-half the volume of fuel of a gasoline engine, it is easy to comprehend the oil engine is a factor worthy of very favorable consideration.

Captain Maclean Reported Missing

Captain A. P. Maclean, who is a son of W. B. Maclean, Toronto, President of the Conger Lumber Company, is reported missing. He enlisted with the 20th Battalion and went overseas in May, 1915. Capt. Maclean was signalling officer from September, 1915, when he went into the trenches until June, 1916. He was transferred in France to the Royal Flying Corps. He is 22 years of age, was educated at Upper Canada College, and at the outbreak of war was in his second year at Varsity.

A brother, Captain G. A. Maclean, who was formerly overseas with the Royal Navy Air Service, and invalided home, left recently for England with a detachment of seventy-five men from the 88th Squadron, Royal Flying Corps, of which he had been in command at Armour Heights for several months.

Personal Paragraphs of Interest

A. J. Young, of the Young Lumber Company, Toronto, returned recently, after spending several weeks in British Columbia. He reports that the prospects for the lumber industry during the coming season are exceptionally good, and that all prices are well maintained. Twenty-seven wooden ships are being built in Vancouver and vicinity, which has imparted considerable activity to many lines in the timber trade.

Frank and Ormsby Oliver, of the Oliver Lumber Company, Toronto, spent a couple of weeks recently in New York and other Eastern centres on business.

Major William F. Cooke, Kenneth McDougall, and Garnet Strong, of the Canadian Forestry Corps, have been awarded the D.S.O.

EDGINGS

Ontario

The charter of the Collingwood Shipbuilding Company, Ltd., has been cancelled.

Work is to commence in the near future on a sawmill at Fullarton, Ont., for R. J. Harmer.

J. E. Cutler & Co., Welland, Ont., recently lost their planing mill by fire. The company have not yet decided whether to rebuild.

The London and Petrolea Barrel Company, Simcoe Street East, London, Ont., who are erecting a dry kiln; at a cost of \$5,000, report that work will commence almost immediately. The building will be of reinforced concrete construction, composition roofing.

Sir William Hearst, Premier of Ontario, has notified the Dominion Food Board that the provincial government will cheerfully grant permits for the making of maple sugar on the crown lands to all suitable parties who are properly equipped for conducting the business.

The Mattagami Pulp and Paper Company, Smooth Rock Falls, are now turning out about 75 tons of bleached sulphite daily, and a third digester will be installed in the near future. Over 600 hands are employed in the mill and woods operations. During the coming summer the company will erect a large concrete storehouse and put up 30 additional cottages for the workmen. Some 70,000 cords of pulp wood will represent the cut of this season's operations.

The Ontario Government proposes to heat all the public institutions of the province with wood, cut upon crown lands, and in this way release a substantial amount of coal for private consumers next winter. This announcement was made recently by Hon. G. Howard Ferguson. The government, he said, felt that if the substitution of wood for coal was necessary it should set an example, and if there was expense to be borne in changing heating equipment the government should be first to bear it.

The new bleaching plant of the Port Arthur Pulp and Paper Company, at Port Arthur, is now in operation, and both bleached and unbleached sulphite pulp are being turned out. About 250 men are employed in the mill. The company has more than 20,000 cords of pulp wood stored in the yards, and 25,000 cords are waiting for the opening of navigation to be rafted in by water. When this is done there will be enough wood on hand to keep the mill operating steadily for a year.

William Andrews, one of the early wooden shipbuilders on the Canadian lakes, died recently in Collingwood, aged 77 years. When a boy he located at Port Dalhousie, at which point his father established the Andrews Shipbuilding Yards, which were conducted by the family until the construction of the new Welland Canal took up their property. Later Mr. Andrews moved to Welland and then to Port Robinson, going to Collingwood to continue wooden shipbuilding with his brother, Stephen D. Andrews, who was one of the originators of the shipyards now owned by the Collingwood Shipbuilding Company. During the operations of the Andrews yard on the Welland Canal William Andrews took part in the construction of many vessels. He is survived by his wife and his brother, who is Dominion inspector of hulls, with headquarters at Collingwood.

Eastern Canada

Lapointe & Pilon, lumbermen, Montreal, P.Q., have dissolved.

The firm name of Smart-Woods, Ltd., has been changed to Woods Manufacturing Company, Ltd.

Craig, Morris & Blair, Ltd., wholesale lumber, have removed to Room 19, No. 11 St. Sacrament Street, Montreal.

Berthiaume Allard & Co., sash and door factory, Montreal, P.Q., has been registered. Z. Berthiaume is interested.

The Davison Lumber Company, La Have Street, Bridgewater, N.S., are contemplating the erection of a sulphite plant in the near future.

Work has been started on a large box factory and planing mill by the Davison Lumber Company, Bridgewater, N.S.

Knox Brothers, wholesale lumber dealers, Montreal, P.Q., have been registered. J. B. Knox and A. M. Knox are interested.

The Davison, Parker Company, Ltd., Davison Street, Halifax, N.S., have awarded the contract for repairs to their lumber warehouse and office.

J. P. Mosher & Sons, lumbermen, Lakeside, N.B., have formed a partnership between Judson P. Mosher, Joseph I. Mosher, and H. Ludolph Mosher.

The Piercy Supply Company, Ltd., Halifax, N.S., report that work is well under way on their woodworking plant. All the necessary machinery has been purchased.

Perron & Co., Ltd., has been incorporated, with a capital of \$49,000, to carry on the business of manufacturers and dealers in lumber and to lease, operate, and sell timber concessions. Messrs. G. & J. E. Perron, St. Jerome; C. Gagnon, St. Felicien; D. Michaud, Chicoutimi, and A. Boily, Roberval, are interested. The head office is in Roberval, Que.

Former United States Senator Robert Stephenson died recently in Marinette, Wis. He was born near Fredericton, N.B., and spent his early life in the lumber woods of New Brunswick. When a youth he went to Milwaukee,

where he found employment with the Wells Lumber Company, and was associated with Daniel Wells, Jr., for a number of years. In 1857 Mr. Stephenson became an operator of lumber camps in his own interests.

The new sulphite pulp mill of the Ha Ha Bay Sulphite Company, at Ha Ha Bay, Que., is now in operation and turning out 150 tons a day. The officers of the company controlling the plant are: F. Becker, of Becker & Co., London, and of Craig-Becker Company, Inc., New York, president and chairman of the board of directors; J. E. A. Dubuc, president of the North American Pulp and Paper Companies, vice-president; Reginald F. Hammond, vice-president of Craig-Becker Company, of New York, secretary and treasurer.

The report of the Union Bag and Paper Corporation for the year ending January 31 shows net earnings of \$3,131,106, a gain of \$298,829. The St. Maurice Paper Company, with timber limits and pulp and paper plant in the Province of Quebec, is a subsidiary of the Union Bag Company, the latter owning 75 per cent. of the stock of the St. Maurice Company. The net profits of the St. Maurice Company totalled \$595,148, a portion of this money being used to pay the balance due on the cost of erecting the new pulp and paper mills at Three Rivers, P.Q.

The lumber camp of A. A. Sutherland, located at Alvin Siding, which is on the Canadian Government Railway, about 15 miles from Truro, N.S., was recently destroyed by fire and 20 persons met death. A. A. Sutherland, of Oxford, N.S., and his son, Max Sutherland, escaped practically uninjured. They were aroused at midnight, when the camp was a mass of flames. As they were sleeping in a separate compartment from the men, they were able to get out in time. The quarters of the men had evidently become ignited and burned quickly before anyone became aware that the place was on fire. One employee who was burned to death also lost his wife and six children.

Western Canada

A. J. Kuno, lumberman, has moved his plant from Eden, Man., to Amaranth, Man.

The Fletcher Lumber Company, Ltd., has been incorporated, with head office at Hanna, Alta., and capital stock of \$50,000.

The Mountain Lumber Company, Ltd., with a capital stock of \$10,000 and headquarters in Vancouver, has been granted a provincial charter.

A charter has been granted to the Western Toy Manufacturing Company, Ltd., with headquarters in Vancouver and a capital stock of \$100,000.

Another shipment of British Columbia lumber was recently sent to the Orient on the steamer Harold Dollar, the shipment being made from the Dollar mill at Roche Point.

A large party of loggers recently arrived at Prince Rupert, B.C., on their way to the Queen Charlotte Islands, where they will cut spruce to fill government contracts for airplane orders.

The Wallace Shipyards, Ltd., North Vancouver, B.C., who are engaged in the construction of wooden ships, are remodelling their shipyard. The alterations are expected to cost about \$100,000.

It is announced that the British Columbia Loggers' Association has adopted the eight-hour day as the standard in the camps for its members. The new regulation went into effect on March 11.

The Mountain Lumber Company, Ltd., has been incorporated, with head office at Victoria, B.C., and a capital stock of \$10,000, to carry on business as loggers and to deal in timber and lumber of all kinds.

Thurston-Flavelle Lumber Company, Murray Street, Port Moody, B.C., recently suffered a serious loss by fire. The dry kilns, mills, etc., were completely destroyed, and the loss is estimated at \$25,000. The company will rebuild at once.

William Landkamer, who for several years held an important position with the Revelstoke Sawmill Company, at Heisler, Alta., recently resigned in order to take up farming. He has been succeeded by Le Roy Strickland, of Camrose, Alta.

A general meeting of the Mountain Lumber Manufacturers' Association was held recently in the offices of the Forest Mills of British Columbia, Ltd., at Revelstoke, when matters of importance affecting the industry of the interior of the province were considered.

Some 68,000 box shooks were recently shipped by the British Columbia Manufacturing Company to Singapore. It was the first foreign consignment of shooks shipped by the Pacific Steamship Company and the first of a series of orders indicating the development of this trade abroad.

J. C. Shields, of Vancouver, who was in Kamloops recently, stated that arrangements were being made to reopen the sawmill at Kamloops for the purpose of cutting about five million feet of lumber during the coming season. The logs will be brought to Kamloops from the Heffley Creek limits by rail.

A cargo of 4,333,438 feet of lumber was shipped recently in an American vessel from Vancouver. This is the largest consignment carried by any ship so far this year. The destination of the cargo, which was shipped from the Hastings mill, was unknown, and the vessel which bore the heavy burden was one built at Seattle for the British, but commandeered by the United States Emergency Fleet Corporation.

The lumber mills in Port Haney, B.C., and the Maple Ridge district generally, are all busy, and every sign indicates a good year's business. The Maple Ridge Lumber Company are busy overhauling their power plant, and will shortly install Dutch ovens and, when properly equipped, the mill will be run night and day. Abernethy & Loughheed have four logging camps in the Stave Lake area getting the timber out.

3" Dry Spruce

3 x 7" — 100 M ft.
3 x 8" — 300 M ft.
3 x 9" — 200 M ft.

No. 2½. Actual Size

Cutting Remarks!

About Tested Teeth

The saw tooth illustrated is the best made for mills cutting heavy steam feeds. This No. 2½ Chisel tooth saw is made in suitable gauges for Edgers, Bolters and Lath Machines.

Better not trust to luck with your lumber sawing—"Hoe" the genuine saw is safe and certain. We know because every one is tested before leaving the "Hoe" factories.

A hundred years experience has taught us how to produce saws that prove durable and trustworthy under the most strenuous working conditions.

Our interesting illustrated catalogue should be in the hands of every Canadian Lumberman. By giving better service, "Hoe" Saws, Bits and Shanks save you money.

R. HOE & CO.

504-520 Grand Street
NEW YORK CITY

One of the most difficult and costly operations in sawmaking is the grinding of blades to taper. Disston Cross-cut Saws are ground uniform in thickness along the entire tooth-edge, gradually tapering thinner to the back. This prevents kerf binding. There is no sacrifice of weight, stiffness or elasticity by the Disston Method of Grinding.

This is one of the reasons why Disston Saws run easiest, cut fastest and last longest.

BELLEVILLE, ONT.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

this belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention !

We have the ONLY device that removes ALL danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, break-downs or dislocation of parts—IT WORKS ALWAYS. Though still new, it is thoroughly tried and tested, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you TEN times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you CAN use them with this equipment; you need it on your cars right now, and you will WANT it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

SLAB WOOD

is as easily barked in an

American Barking Drum

as is any other kind of wood.

This photograph, for example, shows a slab that is being successfully barked on the Pacific Coast.

The Powell River Co., Powell River, B.C., learning of the success of our drums in barking ordinary pulp wood, sent us twelve unbarked sticks, asking us to run them through a standard 10 ft. by 30 ft. American Barking Drum on a regular run. This we did, and the slabs were barked so successfully that a drum was immediately ordered. And, what is more, they were so well pleased with the drums that they are now installing another.

Photographs showing the construction of American Barking Drums have appeared in recent issues of this publication. We have shown a great many different actual installations. We have told all about the progress made in the barking field.

We take great pride in the fact that our drum is, as one gentleman expressed it, "HEAD, NECK AND HEELS" superior to all other barking methods. This is attested in the fact that American Barking Drums are now barking over 50 per cent. of the combined production of pulp wood in the United States and Canada. This is a great record, and it has been accomplished in a little over two years.

We have been so successful, not alone because of the excellent design of the drum, but because we continue to give service even after the drum is sold and installed. We install the machine complete and start it a-going satisfactorily to the purchaser. At any future time we are always ready to advise and assist the user in any way possible.

Unquestionably, if you have much wood to bark, the best way to save a few thousand dollars this year, in addition to paying for the American Barking Drum, is to begin installation right away. We can deliver promptly. You should hasten to get in touch with our engineers, who will give you valuable, honest advice. If it won't pay you to install a drum (and it may not if your plant is small) we will frankly tell you so.

Simply put the matter in the hands of our engineers and they will attend to the rest.

Many Fires in Lumber Mills have been caused by Hot Boxes

This risk can be eliminated by the use of
Chapman Double Ball Bearings

—IN—

Shafting, Hangers, Pillow Blocks
Loose Pulleys, etc.

Chapman Double Ball Bearings

decreases the friction loss 75% and do not generate heat.

No oil is used, a little Tranco Grease once or twice a year is the only lubricant required, consequently dust does not adhere to the outside of the bearing.

There is no spoilage from oil drip, and cleanliness may be easily maintained.

If you realized what these savings mean you will agree that

**You pay for Chapman bearings
whether you buy them or not**

Rubber Goods FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "P.M.S.," "Special Drive" and "Lion" are our leading brands for power transmission.

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable.

Hose for Steam, Water, etc., in various grades, made especially to give satisfactory and economical service under different conditions.

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion.

**GRATON
AND
KNIGHT**

Three Belt-Buying Basics

LEATHER

Of all belting materials, leather is pre-eminent for long wear under hard usage; for frictional grip on pulleys; for standing the strain of main drives and the side-slap of shifters; for ease of repair and splicing; for minimum power-leakage; for that **light-weight** pliability, firmness, and elasticity which good belting must possess.

TANNAGE

Belting leather requires a special tannage. We tan nearly 300,000 hides a year for belting use, giving you two great advantages: All our belts are of leather of the best possible quality for belting requirements. Our enormous stock of hides enables us to maintain a uniformity throughout our product that can be assured in no other way.

STANDARDIZATION

Power transmission needs fall into comparatively few classes. For each one there is a Graton & Knight Standardized Belt. That means a belt which is scientifically built for exactly the class of duty to be performed. It is kept uniform. It pays us to make it standard for quality, because it pays mill-owners to make it standard for use.

Many of the best belted plants ask us to specify the belting for every pulley. Try the plan yourself. Then, when buying call for "Graton & Knight—Brand or equal." This won't commit you to buying our belts. It will put your buying on the one basic consideration—the work to be done.

Write for information about Standardization as applied to Belting.

*The Babbitt Metal that's at the Front in Efficiency
and Economy*

HARRIS HEAVY PRESSURE

THE ARISTOCRAT OF BABBITT METALS**SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well. So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours

JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS**

Your New Saw Mill

Will give you the best service and the longest service with the least expense for upkeep—If it is a Fisher & Davis Mill.

Catalog of Saw Mills, Edgers, Planers, etc., is yours for the asking. Ask to-day!

FISHER & DAVIS MFG. CO. St. Louis Mo.

FIRE BRICK

Differs in Quality and Variety

For instance, a certain quality or kind of brick that gives satisfaction when used in a Refuse Burner, may show up poorly if used in a Dutch Oven.

It all depends on getting the right kind and the right quality for your particular needs.

Just tell us what you want it for, and we'll send a fire-brick that was made for that very purpose.

We Manufacture the Following Well-Known Brands

"Elkco Special" "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this

system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

Steam Log Kickers

The illustration shows our Standard Double Deck Steam Log Kicker which we manufacture with cylinders 8 in., 10 in. and 12 in. bore. This kicker is made for either single or double deck mills. The bottom head of the cylinder is cast solid, eliminating the necessity of taking the machine apart for packing. The joint between the valve case and cylinder is a "ground joint," which is perfectly steam tight and requires no packing.

**Catalogue
on request**

We have the following on hand ready for shipment

one Portable Saw Mill outfit with Right hand Saw Frame and Carriage—set of track timbers, also the following items:
No. 1 Log Jack with foot wheel and idlers.
No. 7 Log Jack with foot wheel and idlers.
10 inch by 36 ft. Steam Feed.

10 inch by 42 ft. Steam Feed—Either feed can be furnished with vertical or horizontal valves.
Double acting set works in No. 1, 2 and 3 sizes.
We have one second hand plain slide valve engine, right hand, side crank, 9 x 13, suitable for a small saw mill plant.

Write at once for information regarding the above or any other equipment you may need

STEEL CARRIAGES

For Fast Cutting Service

Waterous Steel Carriages are being used in the largest and best equipped Saw mills in Canada to-day.

They are carefully put together, of the best materials possible.

These Carriages are designed to give the utmost efficiency and cutting speed.

Lost motion is overcome through improvements in the knee and head blocks. The Waterous dog is supplied on all knees. This is quick and efficient and will operate equally well on any size log or cant.

Our number four set works is of new design absolutely preventing slack. This set works may be attached to steam setter or replaced by Trout power set works. Carriages equipped by friction receder operated with the set works.

*Carriages built any length with any number of head blocks
and in sizes having from 36" to 72" knee opening.*

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 70c per lb.; West of Fort William, 75c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 38

Toronto, April 15, 1918

No. 8

The Increased Stop-off Rates and Shipping of Lumber

What is the most disturbing factor in conditions as they affect the Canadian lumberman to-day? Ask this question of any leading operator and the chances are he will not say the shortage of labor, the high cost of production, the constant demand for more wages, the abnormal advance in the price of supplies, the restricted cut in the bush, the credit system, or loose merchandising methods, but that his answer will be the railways. Now, whether this is true, so far as service and attention, in the matter of shipments, is concerned, is not the question of most interest at the present moment. Whether the roads have exerted every effort and put forth all available organizing and executive ability to furnish adequate transportation, considering the numerous difficulties which they had to overcome during the past winter, is a subject which would involve appointment of a Royal Commission, and then it is doubtful if the finding of such a judicial body would satisfactorily clear up the situation.

A well-known Canadian publisher once remarked that "there are two sides to every question and the truth besides," and the latter is seldom arrived at. But the last straw placed on the camel's back has been the united effort of the railways to curtail the stop-off facilities in connection with the shipment of car loads of lumber and also to double the rates. This service is a factor that has come into the life and movement of the trade, and operates to the advantage of the small mill owner and the retail yard man neither of whom has a planing mill. Many business connections have been built up on this service, and not a few mills make a specialty of dressing lumber in transit. The stop-off arrangement is not only a decided advantage to the interests already mentioned, but it is a link in the chain of many a whole-sale business. In fact, all branches of the trade find it at times a contributing factor in the sale and distribution of the products of the forest, and the proposal to double the tariff from one to two cents per hundred and increase the minimum to eight dollars instead of five, in

the face of the advance of 15 per cent. on freight rates, makes the average lumberman wonder where the demands and exactions of the railways will end, or, if this plan is successful, what will be the next move on the part of the carrying companies.

To restrict the stop-over service to planing, resawing, and sorting would seem in itself to be enough in the way of exorbitancy, but to increase the rate for the accommodation by 100 per cent., on top of a general advance of 15 per cent., savors apparently too much of the avaricious.

In view of the patience exercised by many lumbering firms during the past season, when one-tenth of the cars needed were not supplied, orders placed months and months ago not yet delivered, and other distressing conditions which have been referred to in these columns, to curtail the service and make the rate two cents instead of one, would seem to be "going the limit." At a recent conference the lumbermen put up a strong fight, and when the matter comes before the Dominion Railway Commission, if an adjustment is not effected in the interim, the whole facts of the case will be brought out. It is understood that the railways are now offering certain concessions, and there may be a satisfactory outcome without any radical order being issued by the board. Meanwhile the lumber companies consider they are doing their share in paying the increased freight rates without having an important arrangement in the distribution of the products of many mills, hampered and handicapped by such a rigid revision as that proposed by the transportation interests.

What the Get-Together Movement Can Do for Retail Lumbermen

More is heard about co-operation and conservation to-day than at any previous period in the history of the world. The translation of these words into action is also accomplishing what would never have been dreamed of a few years ago. In the line of getting together, circumstances sometimes force the movement, and out of chaos there is brought order, and from misunderstandings and bickerings harmony and unity arise. Much has been written on this subject, and if there is still any retail lumber dealer who thinks he is from Missouri, and manifests the "show-me" spirit, he will find ample demonstration and concrete evidence of the benefits and advantages of co-operation in the article which appears on another page in this issue of the "Canada Lumberman," from the pen of J. O. Chalifour, secretary of the Retail Lumber Dealers' Association in Quebec City.

There is no need of elaborating on what has been accomplished, for that is ably done by the man who took matters in hand and went to brother dealers in a spirit of sympathy, good-will, and helpfulness. Each found that the special problems which he was up against also affected the other fellow to a greater or less degree. Isolated effort would never have rid the trade in the Ancient Capital of the evils of too much credit and free delivery. But association and co-operation have achieved a great deal, and the business of selling builders' supplies in Quebec City was never on a better mutual basis than it is to-day. The losses through credit, often extended in a jealous rivalry of dealers to contractors who were not able to furnish any security, have been eliminated, and a uniform tariff has been adopted for delivery which is a fair and reasonable one.

Once grant a special privilege or concession, free of charge, and there are scores who will abuse it. To use a colloquial expression, "give certain parties an inch and they will take a mile." The result was that customers, devoting no thought to the quantities required for whatever job they had in hand, would rush to the telephone four and five times and order up additional material, knowing that delivery cost them nothing and little heeding what expense or trouble they put upon the lumber dealer. Then the practice of free delivery was growing to such absurd proportions that some dealers adopted the plan of adding from fifty cents to a dollar for delivery on each thousand feet, as they could no longer endure the loss occasioned through the unbusinesslike methods in vogue. This arrangement was tried and found to work anything but equitably so far as the customer was concerned. On a few boards the dealer sustained a direct loss, while on a larger

quantity the plan operated against the customer who was really taxed too much.

Now all deliveries of lumber and other materials are made within the city limits, at seventy-five cents for a one-horse load or part thereof, and one dollar and a quarter for a two-horse load or part thereof. The outcome has been that customers take the trouble to find out just about how many feet of lumber they will require to finish any job in hand and have the supplies sent up in one load. A great saving has been effected by the new regulation which the dealers agreed upon, and it works to the advantage of both patron and lumber merchant. Better relations exist between the members of the trade and their clients than at any previous period, and all persons are treated alike. There is no room for argument or dispute, and thus the profits of the retailers have been increased, undesirable methods relegated to the scrap heap, and the trade conducted on a sound, satisfactory footing.

Many other matters have been taken up and adjusted in an amicable spirit by the yard owners, and it is safe to say that the leading dealers in the city would not revert to the former order of things under any consideration. What has been brought about in the betterment of conditions and trade customs in Quebec can, with a spirit of concord, liberality and helpfulness, be introduced in any community, large or small, for, as a well-known authority on the "Legitimate Functions of Trade Organizations" aptly and forcefully remarks: "The go-it-alone policy had had its day, with results that all now see and are paying the penalty for. The pull-together policy is that of to-day and to-morrow."

Is the Log Export Problem Finally Adjusted?

To export logs or not to export them?—this has long been a vexed question in British Columbia. After many years' agitation, pro and con, it is announced that the issue has at last been amicably settled. The embargo has been, like Banquo's ghost, in that it would not down, and there has been at times considerable feeling existing between the lumber manufacturers and the loggers.

The sawmill man has contended that it is only right and proper that all logs should be manufactured in the province, and that for the permanence and stability of the industry and the development of the great lumbering interests of the coast the embargo should be restored. In spite of the export privilege, it is stated by the mill men that there has been little or no surplus, and that the price in the Pacific Province is based on what is paid on the other side of the line, and that many shingle and sawmills have been built on the assurance of an unending supply of British Columbia timber. The sawmill men have, of late, been complaining that they could not get an adequate quantity of logs for home consumption, owing to the increase in exportations. They also advanced the argument that turning the logs into finished product meant the employment of more labor in the province, the putting in circulation of more capital, and the general stimulation of the industry. That a country exporting its raw materials never attains the highest commercial and industrial development was another economic reason against the shipment of logs across the line. Millmen have asserted that if they thought there was to be no embargo they would have erected their plants to the south of the border. A number of years ago the British Columbia Government ruled that logs must be manufactured within the province, but in 1914, under special conditions, the restriction was lifted and logs allowed to go over to Washington State duty free. Two years ago the duty was placed on No. 1 and 2 logs, but the exportation has continued under special departmental permits.

The stand taken by the loggers has all along been that the very moment they were restricted to the home market they have found the mill men cutting down the price of the product of the forest; that the lifting of the embargo was a sort of safety-valve and a needed protection of the interest of the loggers, who contend that at no time last year, except in the stress of weather, was there a shortage of logs for the home mills. They affirm that, at the beginning of 1918, there were 135,000,000 feet of logs in salt water in the province, and this did

not look like any scarcity. The men in this industry also submit that if there is an embargo it will reduce the annual logging output and seriously curtail operations. It was emphasized that, under the special export privileges, loggers have vastly increased their plants, and that it would be neither fair nor just to cut off export rights. They also point out that, under the order-in-council, only 1.8 per cent. of last year's cut was exported, and the balance could have been exported in any event.

At a recent conference of representatives of logging, shingle, saw-mill, and box factory interests held with the Minister of Lands at Victoria, a clean start was reached on the perplexing problem and a war advisory committee appointed, which will consider the situation from month to month and report. An official memo has been issued dealing with the situation and the resolutions carried at the round-table conference have been approved by Hon. T. D. Pattullo, Minister of Lands. They are as follows:

"1. That to provide a channel of information for each industry concerned, as well as a method for keeping in continuous touch with the complex factors and changing conditions affecting log supply and demand, there be formed a war advisory committee. This committee to meet once a month and to be composed of nine members—three for the lumber manufacturers, three for the loggers, and three for the department. An emergency sub-committee, consisting of one representative for each interest, to meet, when necessary, during each month, the manufacturers' representative being chosen each month from the industry most likely to be affected by current conditions.

"2. That a fresh start for the consideration of the question of log export be made as from the date of the present meeting, March 20; that the matter be considered at each monthly meeting of the committee in the light of facts as they then exist, and that the recommendations made to the minister at each meeting cover a period of one month ahead.

"3. That, except for logs covered by export permits issued up to March 24 for booms with tugs alongside by that date, there be not allowed up to the next meeting, on April 22, any export of hemlock or fir, nor any export of cedar other than of low-grade cedar booms, approved by the emergency sub-committee."

Protection of the Woods is Practical Community Business

Never have the forestry movement, the protection of the timber wealth of the Dominion and the conception of the potentialities of the natural wooded areas of Canada been so firmly fixed in the public mind as now. What timber is doing for the cause and progress of the Allies, the new uses that wood is daily being put to, and the vital importance of the lumbering interests are being forced home as never before. The strip of woods, once thought to be an encumbrance and a relic of pioneer days, to be wiped out as speedily as possible, has come to have much more significance and prestige. The only way to convince some, otherwise well-meaning, people is through their pockets. Let them pay dearly or suffer a financial reverse in connection with their acquaintance or experience with a proposition and they at once belong to that class who speak not only with authority but from painful conviction. They are then quite ready to listen to wisdom and the advice of others.

The recent shortage in coal, its abnormal value and uncertain delivery, has directed attention to wood as a desirable means of heating our homes and offices. In the past wood has been little thought of, and thus a new sense of appreciation has come to many of the splendid asset which standing timber represents. The sylvan patch on the farm or old homestead is no longer an eyesore, but regarded more in the light of a gold mine. The trees that were thought a nuisance or a barrier are now viewed with pride and affection. How time brings in its wake the upheaval of old ideas and ideals and imparts a broader and more intelligent vision!

Co-operation and Confidence the Basis

How the Organization Movement Has Expanded Among Lumbermen—The Work and Worth of the Bureau of Information—Lumbering More and More a "Man's Business"

By Horace Boulton

Nearly every lumberman in Ontario to-day knows that credit bureaus have been organized and carrying on business for a few years in connection with the retail lumber trade at Toronto and at Ottawa, and also that one has been in operation since the beginning of the present year in connection with the wholesale lumber business of Ontario and Quebec, with its head office at Toronto. The results which are being obtained by these organizations are of a very definite and valuable nature. They provide a means of protection against loss which cannot be obtained in any other way. There are other results, however, of a less evident nature, which are, nevertheless, of importance. An idea of all that these organizations mean to the trade can only be obtained by considering their origin, the reason for their existence and their general moral effect both upon individual members of the trade and upon the trade at large.

Natural Outgrowth of Trade Conditions

The origin of these associations and of others which are being worked out to-day is easy enough to understand. They are the natural outgrowth of trade conditions. The credit problems of business cannot be solved by individuals. Their solution depends upon information which no one firm or individual can obtain. A customer's habit of paying his accounts with one firm may have little or no bearing upon his standing as a credit risk. It is essential to learn how he conducts himself in connection with every firm with whom he deals. Co-operation is the keynote of successful credit granting, and such co-operation becomes possible and valuable just as two or more firms or individuals who are selling to the same customer learn that their interests are mutual and that they can trust one another. The foundation of any successful credit bureau is confidence. If it exists there is no limit to the amount of co-operation possible. The minute confidence ceases to exist, the whole fabric of credit information exchange crumbles.

Out of the chaos which existed in the lumber trade some years ago, when each merchant considered it good business to secure an advantage over his competitor by fair means or foul, order has been brought in many districts by the considerations of common sense, leading to the growth of confidence in one another, and finally, to the formation of associations for the definite purpose of capitalizing this confidence by the exchange of credit information.

The Function of Credit Bureaus

The reason for the existence of these bureaus is already partly explained by the account of their origin, and it is easy to understand. If all customers were honest and equally capable of balancing their expenditures against their receipts, credit granting would be a simple enough matter. There are, however, many types of customers. Broadly speaking, there are the safe customer, the unsafe customer, and the customer who is on the border between the two. The function of the credit bureau is to classify information received in such a way as to indicate definitely to which class a customer belongs and to keep track of the migrations from one class to another. Upon the basis of this information the merchant is able to decide how to deal with a customer, with reasonable certainty that he is avoiding a risk or, not losing a good sale, or that he is delivering goods for which he is going to be paid.

The points referred to above have to do, more or less, with the actual affairs of credit bureau work. All members of the associations already operating in Eastern Canada realize how greatly to their advantage the scheme is working out. The influence of these associations upon the general lumber trade situation, however, may not be as fully appreciated by the trade in general or even by all of the members of the associations themselves as it should. A member of one of these associations will see quite definitely the value of the service which he secures but may overlook the moral effect upon the trade community at large.

The influence of these associations for good is far-reaching. Upon the members themselves it is exerted most forcibly, cementing them in their friendships and leading them into more efficient, progressive and profitable ways of doing business. Upon the members of the trade outside of the associations, while the influence may not be so personal and direct, it is none the less extensive. Take a glance, for instance, at the general situation of the trade in Ontario to-day and compare it with the situation a few years ago before the retail or wholesale lumber dealers were co-operating. In those days there was a certain amount of interchange of credit information between a few firms who

knew one another intimately and were friendly enough to swap experiences. On the other hand, there was a large volume of distrust and evil-minded back-biting between competitors, the results of which were disastrous. It was then an everyday occurrence for those who had intimate relations with lumber dealers, but who stood to some extent on the outside, to hear one firm criticize another and even go to the length of endeavoring to convey to a competitor false information which would lead him to put faith in a customer who was not entitled to it, or to distrust one who did not deserve distrust. By a good many firms in those days it was not considered unbusinesslike to mislead a competitor in this way. The association movement is doing away with this rapidly. Its foundation is the conviction that what your competitor says about a customer is always true.

There is Business for Everyone

It has come to be realized, in short, that even in these days of abnormal trade conditions, there is a fair amount of business for everyone and that a disaster to a competitor may have so direct an influence upon one's own business as to make it worth while to endeavor to prevent it, even by divulging what used to be looked upon as sacred trade secrets.

The moral effect of all this is perhaps equally as important as the practical effect upon the bank accounts of the trade. It is making itself felt upon the business methods of everyone in the trade, whether he is ready to acknowledge it or not. Take, for instance, the retail lumberman who belongs to a credit bureau. The fact that a strong credit bureau exists, which makes it impossible for a dishonest customer to purchase stock on credit, soon becomes known to the lumber purchasing public and the dishonest or unsafe customer finds himself weeded out, so far as the members of the bureau are concerned. Then the good customer finds his lot much pleasanter and he becomes known to all the trade as a man with whom it is safe and profitable to deal.

Results in Reduction of Losses

The moral effect of the new credit reporting plan does not stop here. Retailers who were annually obliged to write off large amounts for bad debts, now find this source of loss reduced to a minimum, as a result of the dependable information which they are able to secure. They are to-day a gilt edged business compared with that of a few years ago. What this means to a retailer in dollars and cents, to say nothing of relief from worry, cannot be over estimated. It means all the difference between failure and success.

The wholesalers have been quick to appreciate this and have been loud in their praises of the improvement which the retail credit bureaus have brought about. It is a frequent thing now, to hear a wholesaler remark that it would pay the wholesalers to finance the retail credit bureau, in order to improve the ability of the retailers to settle for their wholesale purchases.

In Ontario, the organization of the retail credit bureaus has acted like the casting of a pebble into a pond. The circle of results has been growing wider. The wholesalers saw the logic of the situation and applied it to their own case. The formation of the Wholesale Lumber Dealers' Association, Inc., may be set down as one of the definite results of the success of the retail bureau. This general moral influence for good justifies the existence of the associations almost as surely as the actual results secured in the form of valuable information furnished.

Weeding Out the Bad Accounts

The Wholesalers' Association is in its early stages, yet its influence is being felt in many quarters already. Good customers of the wholesalers are finding out, in the same way as did the customers of the retailers, that it is to their advantage to be purchasing from wholesale firms which exchange credit information, and are thus able to weed out the bad accounts and encourage the good ones. Nowadays, moreover, there exist, in nearly every line of trade, numerous firms that are finding it difficult to pull through the present trade conditions. The co-operation of the wholesalers makes it possible for those who are interested in such firms to decide upon a definite line of action which in many cases will result in bringing them safely through their troubles. In fact, the co-operation that exists to-day, small as it is compared with its possibilities, is not confined to the retailers themselves or the wholesalers themselves, but is reaching out and bridging the gap between the two branches of the trade. A

friendliness is developing between the branches of the trade which formerly was impossible. In short, the lumber business is becoming more and more "a man's business."

These are remarkable developments when it is considered how short a time has elapsed since their commencement. Their significance is perhaps greater even than has been pointed out. For they mean that the whole organization among the lumber trade in Ontario is upon a solid foundation. There already exists quite a distinct field of co-operation between the different associations, retail and wholesale and this co-operation promises to extend to the larger field of the whole of Canada through the sympathetic assistance of the Canadian Lumbermen's Association.

It may seem somewhat optimistic to predict the extent to which

this movement will grow, yet there is every indication that it will not be long before there will be in existence, in every part of Canada where the lumber trade is of importance, a chain of associations covering every branch of the trade, working out their local and individual problems in their own ways, co-operating with one another on problems which concern all alike and combining to make their influence effective in connection with all matters that concern the trade in general. Some people will consider such an idea as too visionary, but only a few months ago the present organizations were set down by some as being impossible of achievement. There is undoubtedly a definite trend to the whole organization movement in Eastern Canada, in the direction of a self-contained and fully developed scheme of this type.

General Bankruptcy Law for Dominion

**Endorsed by Many Trade Associations the New Measure will Make Insolvency Proceedings Uniform
—Main Purpose of Bill to See that Honest Debtor Can Get Discharge**

It is said that practically every civilized country in the world has a Bankruptcy Act except China and Canada, and that even China is now passing such a measure. After years of agitation and discussion in which various retail and wholesale organizations have given the matter hearty support, there has been introduced in the House of Commons at Ottawa, by S. W. Jacobs, M.P., of Montreal, a bill which will apply to all the provinces of the Dominion. At present each of the nine provinces has a separate and distinct act covering insolvency and assignments, and there is no uniformity or perfection in any of them. The insolvency act in one province may possess desirable features in certain respects and be lamentably weak in others. The deficiencies sometimes favor too much the creditor, and in other instances the scheming and dishonest debtor. The legal machinery is too involved and the method of disposing of estates often irksome and tedious to a degree.

Then it is argued that enough distinction is not made in the case of honest assignor versus the dishonest man who resorts to every trick and device to get ahead of his creditors and make away with as much collateral as possible. The main purpose of the measure introduced by Mr. Jacobs is to see that the debtor can get a discharge from his creditors. Under the Ontario Act at present if an honest man who has been up against it, fails and makes a settlement at so much on the dollar after his effects have been disposed of by the assignee, he is by no means relieved of the remaining amount due unless he secures a discharge from every creditor. No legal means can be undertaken to force creditors, who may hold out to sign a receipt in full, as it were, and thus the insolvent may have the obligation hanging over his head perpetually. Times may get good, he may decide to re-enter business, but he cannot do so in his own name and has to resort to various expedients. There is no distinction made at the present time between the honest and dishonest trader in the matter of securing a discharge or release, and under the law all are treated or regarded alike. Every one is thrown into the discard.

New Bill is Widely Favored

Now under the new bankruptcy act which has been endorsed by various trade organizations, including the lumbermen's associations, it is proposed to separate the sheep from the goats in the matter of assignments and afford the honest trader an opportunity to begin over again with a clean sheet. There will be no sword hanging over his head and a debtor, who through his misfortune or short sightedness has been obliged to assign, will be afforded the necessary relief. Many provisions of the English and American bankruptcy acts have been embodied in the proposed Canadian measure, by H. P. Grundy, K.C., of Winnipeg, who has drafted the bill after a most exhaustive and thorough study, while new features deemed fair and reasonable have been incorporated in this progressive legislation. A synopsis of the proposed bill has been issued by the Canadian Credit Men's Trust Association, Limited, which covers succinctly the various points in regard to involuntary bankruptcy, assignments and compositions, trustees, their appointment and administration of estates, creditors, debtors, and bankruptcy offences. The first part of the act dealing with involuntary bankruptcy sets out what acts committed by a debtor constitute "Acts of Bankruptcy," entitling his creditors to present a petition to the court asking for a receiving order. For example: if the debtor makes a fraudulent conveyance, or gives a fraudulent or preferential security to one of his creditors, or if he becomes insolvent, or if he assigns or removes any of his property to defraud creditors, he commits an "Act of Bankruptcy."

Then if he does not make a voluntary assignment for the general benefit of creditors, as provided by part 3 of the Act, a creditor, or creditors, may proceed against him by petition to the court for a receiving order.

This part also makes provisions for the appointment of an interim receiver if the court thinks fit. Also the winding-up under the provisions of the Act of the insolvent estates of deceased persons.

Part 2 of the Act does not apply to wage-earners, or persons engaged solely in farming or the tillage of the soil. Now although part two is modelled on the English Act, there is this important difference—Under the English Act when a receiving order is made appointing the official receiver, the court still continues in full charge, the official receiver prepares a statement of the debtor's affairs and calls a meeting of creditors, then when the creditors meet a trustee is appointed, who can make no important step without applying to a judge for directions; so that they have a judge, official receiver, trustee, the registrar and other court officials, to say nothing of the solicitors, all helping eagerly, to do what? Why, merely to sell a stock of merchandise, collect some book accounts, and distribute the money among creditors. It seems, and it is, absurd.

Now, in order to save the wholly unnecessary expense and delay involved in this procedure, the proposed act provides that when a receiving order is made, the judge names as a receiver, a trustee appointed under the Act; the property of the debtor then vests in the trustee, and without further intervention by the court or its officials, the trustee proceeds to close out the estate, as if an assignment had been made.

The Matter of Voluntary Assignment

Part 3 of the proposed Act is a radical departure from the procedure contained in the English and American Acts, and in the Acts of other countries having bankruptcy laws. It should recommend itself to both debtor and creditor classes in Canada, because it contains the voluntary system of assignment for the benefit of creditors to which we have been accustomed without court proceedings or machinery. New legislation should not disturb or change existing laws or usages more than is necessary.

Under the provisions of this part any person, firm or corporation may make an assignment for the general benefit of creditors.

Although a farmer cannot be adjudged a bankrupt, or a receiving order made against him, under the involuntary procedure by part 2, he may if he chooses make a voluntary assignment under the provision of part 3.

In regard to debtors, provision is made for the discharge of a debtor if he is reasonably honest and certain duties are imposed upon him. It is said that our present insolvency laws are deficient in not requiring debtors to attend personally the first meeting when required to do so.

The provisions as to discharge apply to both a bankrupt and an assignor—the sections of the English Act have been wholly adopted, for inquiries among commercial interests in England show that no complaint exists on the part of creditors to that portion of the English Act relating to the discharge of a bankrupt, or to the manner in which the Act is interpreted and administered by the English Bankruptcy Judges.

The discharge of the debtor will be refused if he has committed a misdemeanor under the Act.

Must Have Clear Record on These

The discharge will also be refused, or suspended, or granted only on fulfilment of certain conditions in a large number of cases where the debtor has not carried on his business according to "Hoyle." A few examples of these are:

1. Failing to keep proper books of account.
2. Continuing to trade after knowing himself insolvent.
3. Failing to account satisfactorily for deficiency of assets.

4. Giving an undue preference to one or more of his creditors.
5. Having previously been adjudged or made an assignment.
6. Been guilty of fraud.
7. Culpable neglect of business, etc., etc.

It is not proposed that a discharge shall release the debtor from debts for necessities of life, unless the judge deems it advisable.

A careful scrutiny of this part shows that the honest debtor would have no difficulty in obtaining his discharge.

Nearly all the bankruptcy offences mentioned in the English Act, and the offences provided by the American Criminal Code have been gathered together in part seven.

An honest trader, or even the trader who is honest or dishonest from expediency need not fear any of the provisions, but on the other

hand, the honest man will benefit by the better controlling of his dishonest competitor—who when he makes a failure and his wife buys in the stock at a rate on the dollar, can afford to, and does, undersell the honest trader.

The only persons who can reasonably object to the provisions of this part are the business crooks—the men who are lowering and keeping low the standard of business morals in Canada. Why should not our standard of business morals be as high as that of England? The provisions of part seven are not too harsh for England, and why should they not be enacted here? Is it because of the foreign born trade who is becoming more numerous every day? If so, why should we not educate the foreign trader up to the high standard of English business morals rather than permit him to lower ours?

How Rising Costs Have Hit Lumbermen

Expenses of Camp Maintenance Have Enormously Increased—Everything Required in Logging and Mill Operations is at an Abnormal Price—The Closing of the British Market

By Elihu Woodworth. Parrsboro, N. S.

The high cost of living resulting from the great war affects in varying degrees all classes in the community, and in some respects may be said to have universal application, but in some important particulars the enormous increase in prices seems to be felt with special severity by those engaged in lumbering. This is due to the fact that the conditions governing lumbering operations differ materially from those which regulate and control other industries.

A very marked difference between lumbering and many other industries comes prominently to the front in the matter of food and lodging. As a general rule the employers of labor in other occupations do not undertake to feed or lodge those who work for them. Even in places where it is necessary to establish boarding houses for the accommodation of some of the employees, a considerable portion of them will usually be found living in their own homes. In lumbering operations the nature of the employment renders it impracticable for any of the men to cater for themselves. Therefore, when half a hundred or more sturdy lumberjacks make an all-winter's engagement, and go into the woods, miles it may be from the nearest village or settlement, to keep them supplied with an abundance of well-cooked nutritious food, and an abundance will be needed, becomes a serious proposition, and one that requires not a little executive ability to handle.

The Sharp Advance in Supplies

Of course, lumbermen require and receive the same kinds of food that are supplied to other workmen, but there are some staple articles which from their universal use in lumber camps, may almost be regarded as specialties, and have been subject to a very marked advance in prices. Prominent among these staples may be mentioned pork and beans—two standard articles of food generally used in conjunction, and proved by long experience to be admirably adapted to sustain hard-working men exposed to the rigors of our maritime winters. A few years ago prime pork might be bought for thirty dollars per barrel—or less. Now clear pork is quoted at sixty-eight dollars per barrel. This is certainly a pretty strong advance in price, but is small in comparison with the increase in the price of beans, which now cost at least two hundred per cent. more than when the war began. Corned beef, which is an important item in the lumber camp bill of fare, has not shown such a violent upward tendency as either pork or beans, but plate beef, such as is now quoted at about thirty-two dollars, could have been bought a few years ago for little more than half the present price. Molasses, of which large quantities are used in the average camp, costs at least twice as much as it did two or three years ago, while the advance in the price of butter, cheese, lard, eggs, sugar, flour and a hundred and one other essentials is felt by the caterer for the lumber camp or cook-house the same as by any housekeeper in town or village.

But the advance in cost of provisions, great as it is, is not the only obstacles the lumber operator has to encounter and overcome. Lumbering in this province cannot be successfully carried on without horses, and horses as well as men must be fed. Fortunately for lumbermen the price of hay, although higher than it has been for years, has not yet become prohibitive. With oats, however, the limit must be pretty nearly reached.

Oats, Once 23 cents—Now \$1.50 Per Bushel

A lumberman who formerly operated largely tells me that he once bought his winter's supply of oats for twenty-three cents per bushel. This, undoubtedly, was an exceptionally low figure, but for many years the price of oats ranged from thirty to forty-five cents, and before the war forty cents would perhaps have been a fair average. Last fall, when the lumber camps were being outfitted, the price rose to ninety

cents, and finally climbed to one dollar. Now the price of oats is quoted at \$1.25 per bushel, wholesale. This is not the maximum price, either, for some Nova Scotia farmers, who have the reputation of turning out clean grain, have already sold their last year's crop of oats, for seed, at \$1.50 per bushel. The man who buys oats now will have to pay about three times as much as was paid a few years ago, and the high cost of living affects the teams in the lumber woods as well as the teamsters and choppers.

However, the abnormal prices of provisions and feed are not the only advances the lumber operator has to meet. Everything required in his business has appreciated in price, and although all the increases are not equally large, yet they are sufficient to make a big difference in the final results. The prices of axes, saws, peavies and cant hooks have probably advanced somewhere in the vicinity of fifty per cent. Harness, sleds and chains have largely increased in price, and in short everything required in lumbering operations costs much more than it formerly did. Of course, there has been a considerable advance in wages, but not so large as in many other employments, and the scarcity of men at any price is the greatest difficulty in that line. In the associated industry of shipbuilding men are not only very scarce, but wages are extremely high. Some important branches of the art were acquired by only a limited number, and of that number very few remain. Consequently, shipsmiths, caulkers, dubbers and riggers can command almost any amount of wages they may choose to ask, and the same holds true with regard to wooden shipbuilding in the neighboring states.

Some Effects of Transportation Handicap

The price of lumber has largely increased in late years, or it would scarcely pay to continue the business. Some of that increase occurred without a corresponding advance in the cost of production, and the operators reaped the benefit. Now they are handicapped by having their best market closed for an indefinite period, but the demand in the United States has grown greatly. This in its turn is partly offset by transportation problems. The scarcity of bottoms has augmented freight rates to such an extent that nearly three prices have now to be paid for carrying the lumber to market, and there is no assurance that sufficient vessels can be obtained at any price. Some lumber is being sent to market by rail, but this is a very expensive as well as a very tedious process, and it is feared that little can be done in this way to relieve the congestion.

Owing to the closing of the British market and the scarcity of labor the output this year will be considerably smaller than usual—the smallest in fact, for many years—but if it can be got to market at present prices the results will be fairly satisfactory. If, however, some of this year's cut has to be added to the large quantities already held over, the owners will have the satisfaction of knowing that it still represents good value, and that they still have a reasonable prospect of being recompensed for their enforced waiting.

Hon. E. A. Smith, Minister of Lands and Mines, has introduced in the New Brunswick Legislature bills providing for a Forestry Advisory Commission of five members, and for forestry protection in the province calling for an expenditure of \$100,000, which will be met largely by a special tax on wild lands and on Crown leaseholders. There has also been introduced in the New Brunswick Legislature a new Workmen's Compensation Act, which relieves the individual employer and provides for the payment to injured workmen from a general fund assessed according to the class of industry in which each workman is employed.

Practical Ideas on Present Day Problems

THE average retail lumberman wants to get what he pays for, and I believe that is what the shipper wants to give him, and it is my belief that there should be an effort made to create closer co-operation between the wholesaler and the retailer not entirely as individuals, but through their organizations. Misunderstandings have been the cause of endless trouble and loss of money to both, and it would be to the shipper's advantage as well as the retailers' to have every point covering an order thoroughly understood by both before the order is finally placed.

If you want the stock air dried and will accept slight stain, say so. If you must have for your trade 13-16 x 5½ or 7½ inch face, say so. If you want 18-foot and 20-foot, state the amount you will take. Then see to it that the shipper lives up to his agreement.

We can not, of course, be dictatorial, but these are all requests that can reasonably be made and in most case would be granted by the shipper. If he could not live up to them he would say so and you know just what to expect.

In our office we have made up a list of items to be observed when ordering a carload of lumber. We find that when it is used there is seldom a dispute when the car arrives, but when it is overlooked, something always turns up that is not just as we expected. We have on this list some things you would not think necessary, but you would be surprised how many things it calls to mind when ordering. I will mention a few of the items: Route, terms, time of shipment, width or average width, lengths, percentages of shorts, percentage of long, grade, bundling, air dried, kiln dried, finished thickness and width, amounts of each kind, total amount in car, box car or open car, and piece tally with invoice.

Besides exercising care in ordering lumber there are other things which we should avoid in order to keep our relations good. Do we quibble over little things? Do we send our statements within the specified time? Are we fair minded in our judgment even though a car is slightly off? I claim that we as retailers are to blame for many of the misunderstandings that lead to loss where many a transaction would be profitable and thousands of dollars saved.

On the other hand, the wholesaler must do his part and meet us at least half way, and here is where our association comes in.—R. B. Chapman, before N. Y. State Retail Lumber Dealers' Association.

Get Enthusiasm—More Enthusiasm

SOMEONE has said: "Enthusiasm is the headlight on the train of progress." Emerson said: "Nothing great was ever achieved without enthusiasm." For example, enthusiasm discovered America, led to the Declaration of Independence, and made the United States.

Enthusiasm was a dominant quality in Alexander, Hannibal, Caesar, Napoleon, Washington, Lincoln—Burns and Gadd.

Enthusiasm is contagious! If the head of the house has ginger germs, the other members of the establishment will catch his enthusiasm. That is, they all should become inoculated. And if they're not, it's because they're immune.

You know the kind of humanity that's immune to enthusiasm. They're human wet blankets. Job's comforters, the cheer-up-the-worst-is-yet-to-come crowd.

Enthusiasm is the characteristic quality of actives. There are two classes of men—the actives and the passives. The actives are, first of all in control of themselves and then are actively thinking and doing for self-advancement. The passives are slaves to their work and to their environment generally. The active man is always reaching out—reaching out for new ideas, for new friends, for new opportunities, for everything that is worth while, and this reaching out process slowly, but surely, brings results.

Enthusiasm sells goods. An enthusiastic salesman can sell horse liniment to a man who owns an automobile; an enthusiastic real estate dealer can sell a swamp to a man with inflammatory rheumatism, an enthusiastic builder can sell a fireproof building to a merchant who needs insurance.

It's the same in every line. The enthusiastic minister is the most convincing: For example, Henry Ward Beecher, Cardinal Gibbons, Rabbi Wise. The enthusiastic actor is the most impressive: For example, Irving, Mansfield, Bernhardt. The enthusiastic business man is the most successful: Carnegie, Schwab, Patterson. The enthusiastic speaker is the most persuasive: Wilson, Roosevelt, Billy Sunday. The enthusiastic advertising man commands the biggest patronage: Barnum, Wanamaker, Ford.—Wm. G. Rose, before Hardwood Manufacturers' Association at Cincinnati.

Pushing the Sale of Side Lines

I AM sorry to say that I think a specialty line or side line, is the first to feel the conditions under which the country is at the present time. Two large concerns in our town had given us orders for a large amount of floor enamel, but these orders were cancelled with the reason given that conditions would not warrant the expenditure. However, had either one of these concerns needed a new floor for their factory neither would have hesitated five minutes in making repairs.

The whole thing sums up in the fact that it does not make any difference whether you are selling lumber, cement, tile or floor enamel, you must give your customer service and fair treatment in order to get business. If the dealer gives his customer service he will get his share of business even though his price may be a little higher than his competitors. If a contractor orders a load of lumber from you he had rather pay you 50 cents a thousand more and have that lumber delivered when he wants it than to pay a less price and have it delivered, possibly, after six or eight carpenters at the rate of 50 cents an hour, have been standing around waiting for it.

If we have an order for five pieces of 2 x 4 to go to the other end of the city, we try to get that order to our customers as promptly as though the order was for five thousand feet. It is true that the cost of delivery of the small order is more than the profit on the goods, but if you take care of the contractor with the small order, when he wants a larger one you are the first man he thinks of.

There are times when any salesman has to use good judgment in the extent to which he pushes the sale of his product upon the prospective buyer. This is especially true in the specialty lines and to explain this I will give you a little incident: A certain contractor in our town had just finished a building and wanted some twenty-five gallons of floor enamel to use on his floors. This, of course, we tried to sell him. But figuratively speaking, he was married to another brand and did not take to ours. We immediately dropped trying to make a sale. This same contractor was about to build another large building and a few days later we went to him and sold lumber, cement, etc., for this job. The result was that we received a large portion of his business. I am fully convinced that had we pushed the sale of the little floor enamel the contractor might have gotten sore, with the result that it might have cost us his business.—R. G. Pratt, before the N. Y. State Retail Lumber Dealers' Association.

Co-operation in Production and Distribution

RIVALRY without co-operation means reckless, destructive competition; co-operation without rivalry means price fixing—the dry rot of business—deservedly condemned by the law.

We have learned some tremendous economic lessons since this great war started. Among these lessons count as the greatest and most important the lesson in the advantage of co-operation. Patriotism is the desire for co-operation in the conduct of government. Co-operation is the manifestation of patriotism in the conduct of business. Shall we go farther and say that restrictive laws are out of place and abhorrent to the idea of co-operation? We may now view the trust movement as the first step towards the attainment of co-operation. If the idea was abused, if it worked tyrannically and unsatisfactorily in relation to the consuming public, it must be taken nevertheless as the first step towards a co-operative attainment that is bound to be achieved. Why? Because the first idea of the trust makers was economy—economy in production. Economy in production has nothing whatever to do with control of distribution, and it was in the control of distribution and the efforts to secure control of distribution that the abuses came. The trust men forgot that there can be no complete co-operation unless the public is considered. The public must be considered and it will be considered. We must have co-operation in production for the sake of economy. And we will have competition in distribution also for the sake of economy. The first economy will make commodities cheap for the producer and the second will make commodities cheap for the consumer.—C. A. Hinsch, before Hardwood Manufacturers' Association.

The first consignment of rived spruce from the Queen Charlotte Islands has arrived in Prince Rupert for shipment to the manufacturers of aeroplanes. It consisted of 12,000 feet, and came in all lengths and sizes. The timber is straight-grained and is split out of the log lengths in the woods in much the same manner as the old-fashioned rails for fences were split in the eastern parts of Canada and the United States.

New Brunswick Changes Timber Policy

**New Method of Scaling Adopted—Regulations Regarding Cutting of Spruce and Fir—
Stumpage Rates Raised—Sale of Timber Licenses in August**

The report of the Crown Lands Department of New Brunswick has recently presented to the Legislature and embodies several new features in connection with the timber land policy of the province which are of much interest to timber and pulpwood operators, as well as lumbermen. Hon. E. A. Smith, who presented the report, stated that the income of the department was greater than that of the previous year. So far as he could see as long as the war continued, there was little prospect of a larger cut from the Crown lands. The outlook for a large return for the present logging season was not promising. From the information at hand the cut would not be more than fifty per cent. as compared with last year. One of the first questions that the government had taken up was the unsatisfactory method of obtaining a true account of the lumber cut on Crown lands.

The general principle, he said, was to pay the scaler a flat rate of seven and one-half cents per thousand on the logs he scaled, this presumably being thought an incentive to the scaler to get as large a count as possible to remunerate him for his activity. However well this may look in principle, in practice it is not borne out.

We have therefore decided to commence building up an outside service by utilizing to some extent the forest engineers, and gradually eliminating the objectionable features of the present system.

During the short time I have been in office, I am convinced the present methods of scaling are antiquated and very often not much more than a guess, said the speaker.

Size of Spruce and Fir

Having been convinced of the difficulties of lumbermen in estimating the size of the tree to be cut in accordance with the regulations, I have seen fit to change this regulation by providing the simple requirement of a stump diameter, viz., 12 inches for spruce and 9 inches for fir inside of bark, said the Minister.

Early in the season I sent a circular letter to every operator on Crown lands under the authority of legislation passed at the last session, asking for the cut on both granted and Crown lands. The responses from the lumbermen, to a very large extent, were unsatisfactory. As the law was enacted after the operations were completed last season, I have concluded, however, unwillingly, not to press the matter too strongly against the lumbermen in this connection, but should proper returns not be forthcoming during the present season, the law will have to be invoked and the penalties claimed as provided by the timber regulations.

The tremendous rise in the price of pulpwood has given an impetus far beyond anything ever experienced before in this province, to the cutting of this wood. As a natural sequence trespassing is a common occurrence requiring great vigilance on the part of the scalers in reporting these trespassers, who are now required to pay a penalty

stumpage of \$3.75 per cord or in superficial feet \$7.50 per thousand. One of the hard problems I found in taking over the administration of affairs in this office was to know how to deal fairly with the settler on Crown lands in disposing of the pulpwood he cuts in making his clearing. If it were a matter dealing with bona fide settlers, then the problem would be a simple one, but where the records of the department show that a very large proportion do not fulfill the requirements of the settling act, it will be seen at once the question of dealing out justice is approached with a great deal of difficulty. Accordingly I gave orders that all green pulpwood cut outside of the first ten acres be subject to a stumpage of \$3.75 per cord, burnt wood \$1 per cord and payment be exacted by the department. When it is shown that the settler has complied in every way in homesteading his lot, then 75 per cent. of the stumpage collected will be returned to him.

My proposal for this new Crown land policy is to remove the administration of the forests to a very large extent, if not altogether, from the sphere of politics. It is proposed to combine the following services, viz.: Protection of forests from fires; scaling of lumber cut on Crown lands, and protection of game, with one efficient staff the chief officer of which will be the director of forest surveys under a board consisting of the Minister, the Deputy Minister, the Director of the Forest Branch and two others, one representing the leaseholders and one representing the owners of Crown granted timber lands.

The board will have authority to appoint the necessary staff to carry out these duties and the men employed to possess the necessary qualification after examination.

A new up-to-date fire service to be inaugurated to include the organization of sufficient competent men to cope with forest fires in all parts of the province, whether on Crown or granted lands; building telephone lines in the forest; erection of lookout stations; cutting fire trails; necessary tools for fighting fires; gasoline engines for railway work; in short, everything that experience has taught is necessary in the prevention of the great fire evil.

On the first of August, 1918, the licenses which were sold in the year 1893 and not renewed under the legislation passed in the year 1913 will expire. There was strong influence brought to bear that we shall allow the licensees to pay the bonus and interest an amount that would equalize the payments made by those who renewed their licenses under the legislation referred to, but the government thought it would be more advantageous to the province to allow these lands to go up for sale.

In these days of high stumpage values it was our opinion the tariff rates existing when we came into office were not in keeping with those charged by owners of private lands, accordingly we raised the rates on spruce from \$1.50 to \$2.50 per thousand, other lumber in

Hon. Irving R. Todd, of Milltown, N.B., widely known in the lumber trade, who was recently appointed a member of the Upper House, Ottawa, and has taken his seat.

Capt. A. P. Maclean, son of W. B. Maclean, President of Conger Lumber Co., Toronto, who is reported missing. He is a member of the Royal Flying Corps and 22 years old.

D. McLachlin, Arnprior, Ont., who is first vice-president of the Canadian Lumbermen's Association and a member of the Joint International Committee of that body.

proportion. The increased rate has been well received, so far as can be ascertained, by the licensees. The renewal rate of \$8 a square mile annually has been left the same.

During the year arrangements have been made for the placing of five parties in the field, whereas last year there were but three. These parties completed the survey and inspection, under forestry methods, of 925,000 acres, which is now being tabulated and mapped in this department. The total area surveyed so far amounts to \$1,245,000 acres, or 16½ per cent. of the Crown lands. While the cost of labor and supplies has increased from last year the cost per acre of the survey makes a very favorable showing. The figures are as follows: 1916, \$27.20 per square mile; 1917, \$27.07 per square mile. The total amount expended since the inception of the survey is \$44,574.57.

There has also been introduced in the New Brunswick Legislature, important measures with the object of giving greater protection to the forests of the province and to stop the wastage which has been going on for years. In speaking of the proposed new Acts Hon. Mr. Smith said in part:—

The most casual observer could note that the forests are failing. It would take only a visit to the rivers or mill ponds to see the change that had taken place within a comparatively short time, in the size and quality of the saw logs. Fir, which a few years ago was left standing in the forest, had come to a compromise thirty or forty per cent. of the operations. This was prima facie evidence that the spruce was being depleted rapidly. In the early days of New Brunswick, white pine formed the most valuable part of the forest, and huge quantities of that timber were exported to Great Britain. White pine failed to reproduce to any extent and little remains in the province at the present time. Later spruce was in demand. Large mills and scores of portable mills were operated to meet the demand for spruce and in consequence of the indifference and the wasteful methods of the jobbers, spruce fast was going the way of the pine.

Scalers' returns from 1910 to 1917 inclusive give a total cut of 2,228,337,215 feet, an average cut of 275,500,000 feet per year. This would indicate that the present assumed commercial softwood stand is about eighteen times the average cut of the last eight years. This did not mean that the softwood would be exhausted in eighteen years, because the annual growth was applied against the annual cut.

An annual growth could be expected on the greater portion of the timber estimate given before, and also on under size spruce and fir, which would be in the vicinity of 5,000,000,000 feet. Some of the under sized timber would reach commercial size in eighteen years. The average annual growth would apply to not more than five million acres.

Should Not Do Contracting Business

Let Regular Customers Carry on This Work Says
Head of Live Lumber Firm

K. J. Shirton, Dunnville, Ont.

"We consider contracting a separate business in itself, and believe that it would be better for the lumber dealer to let regular customers do this work. However, it seems to be impossible to eliminate contracting completely, as very often we have found it necessary to take a contract to prevent losing the supplying of material for the job."

This is the opinion of K. J. Shirton, president of the Wm. Shirton Company, Limited, Dunnville, Ont., which firm has been in business since 1896. The founder was the late William Shirton, who launched and successfully ran it until his death in 1909, when a partnership was formed consisting of the heirs of the estate. This arrangement continued until four years ago, when a joint stock company was organized, with K.

J. Shirton as president and Arthur S. Boyer as secretary-treasurer. The company are manufacturers and dealers in lumber, lath, shingles, fence posts, lime, pulpstone plaster, plastering hair, cement and coal, and have specialized in cross arms for telephone and electric lines, running this department as a side issue of their general business. Last fall a branch yard was started at Port Colborne, which is under the management of R. Barnhardt.

The Wm. Shirton Company have at Dunnville a well equipped and thoroughly modern planing mill and in the plant and yard employ

about twenty men. All the mill work for both Dunnville and Port Colborne is done at the latter place.

"We do no contracting at Port Colborne, and are trying to eliminate it from our Dunnville business as much as possible," declared Mr. Shirton, who is an enthusiastic member of the Ontario Retail Lumber Dealers' Association. "We believe," he added, "that one of the best ways for retailers to economize in the management and control of their business is to co-operate and learn from one another how to figure costs and profits properly. No man can know too much about the line in which he is engaged and no matter how well and successfully we may conduct our several businesses, we should never get too old to be taught, and the other fellow may have some ideas and suggestions well worth adopting. There are many matters for the Association to take up, such as freight rates, insurance, transportation, standardization grading of lumber, Workmen's Compensation Act and other problems. We believe that no retailer can afford to do without the services of the Association."

The storing and shipping facilities of the firm are very convenient. At Dunnville the company have ten thousand square feet of floor space in sheds and at Port Colborne about three thousand square feet. For shipping and unloading, a G. T. R. siding runs the length of the yard at Dunnville and a T. H. and B. siding is within one hundred yards of the plant. At Port Colborne, which place is growing rapidly, a very satisfactory business has been developed since this branch was established, and the yard is within a block of the G. T. R. team siding.

Always Have Good Stock on Hand

Tillsonburg Retailer Believes in Having Full Line
of Stuff to Satisfy Trade

"I try to keep a full line of stock in shingles, lath, doors, etc., and being in a country town the farmer usually gets what he calls for. I also take orders for interior trim and for sash, and have them come as specified. I am only a beginner, comparatively speaking, in the retail lumber game, but of two things I feel sure. One is that prices are going to be firm throughout the coming season, and the other is that a retail dealer is safe in always having a good stock on hand."

So said Harry Hazen, of Tillsonburg, Ont. He has been more or less in touch with lumber all his life, and from boyhood up has handled timber. He always liked working in the bush, and in his youth gained much practical knowledge from such operations. Mr. Hazen is a son of John M.

Harry Hazen, Tillsonburg, Ont.

Hazen, of Houghton Centre, a pioneer, of Empire Loyalist stock, who settled more than fifty years ago near Lake Erie, and there endured the hardships of hewing out a home in the virgin forest. Mr. Hazen, Sr., showed a little of the spirit that was in him by shouldering a rifle in defence of his country at the time of the Fenian Raid. In a log house, 16 x 20, made out of white oak (which building still remains as a sheep pen), a family of seven children was raised. They all knew what hard work was and could use the axe and saw at an early age. By pulling together they managed to create a home for themselves and the five boys all had 100 acre farms.

In 1916, Thos. Crawford, an uncle of Harry Hazen's, who had conducted a lumber yard in Tillsonburg for a long time, passed away. The subject of this reference thought that his opportunity to get into a business which he had always liked, had arrived. He sold his farm and bought the stock of lumber from the estate. By careful management he has succeeded in keeping things going. Mr. Hazen said he started buying a car at a time from reliable firms and found business very satisfactory, with, of course, a few trying experiences. He installed an Elliot Woodworker last fall, which is the only machine he has yet. This does mostly all the work that is required, such as ripping, making frames, and other odd jobs which Mr. Hazen looks after in his spare hours. His yard is situated near the G. T. R. track, from which a siding extends to his premises, thus enabling him to do most of the unloading right off the car.

"I think I will be more satisfied," concluded Mr. Hazen, "to continue along present lines and not trouble about millwork. I find that I cannot compete with the big mills around here and I nearly save the price of dressing in the freight."

Camp Cars Latest Thing for Lumberjacks

Writing to the "Canada Lumberman," a St. Paul lumberman says: "I have read with much interest the discussion in your paper on the proposed system of cottages for the housing, as outlined by Mr. Fitzpatrick, of the boys in the woods. In the early days, when my father was active on the headwaters of the Chippewa River, in Wisconsin, the old style camps were in vogue which, I presume, are somewhat similar to the accommodation now furnished in a good number of Canadian camps. As things went on, it was found necessary to improve conditions until, at the present time, the so-called lumberjack lives in the lap of luxury on the Pacific Coast.

"I am enclosing a clipping giving a description of the latest 'wrinkle' in camp equipment. The company mentioned is one of the concerns in which we are interested, and their cars are very similar to the ones we are still using in our larger operations near Stillwater, Washington. Cars of the character mentioned cost at the present time about \$1,200 cash and, for big operations, we would consider them much better than the old style camps. As cutting progresses the cars can be moved from place to place, thus keeping the men close to their work at all times.

"In spite of the comforts and conveniences which the men now enjoy, we still find that a large majority of them are of a roving disposition, and we are now considering giving our men an opportunity to buy cut-over lands in the vicinity of our larger operations. In this way we hope to get a greater percentage of married men, who will build homes on property purchased from us, thus giving us a more permanent and better satisfied class of labor."

The clipping enclosed states that the Snoqualmie Falls Lumber Company, of Snoqualmie Falls, Wash., has gone the limit in providing clean and comfortable quarters for the men and that a camp train, located at Snoqualmie, consists of twelve cars. The two dining cars are 60 x 15 feet; the kitchen car is 44 x 16 feet; the commissary car is 60 x 14 feet; the office car, power plant car and dryroom and shower bath cars are each 60 x 14 feet. The five bunk cars are divided into three rooms, with 10 men in a compartment. The cars are steam heated and electrically lighted throughout, with hot and cold water in every car. A. H. Onstad, the sawmill designer and engineer, made the plans for the cars. Mr. Onstad says it may be possible, if another set of camp cars is to be built, to provide for a corridor in the car, which would permit bathing facilities in each end of the car so the men could go directly from their berths to the bath. Sanitary toilets are provided and every effort has been made for the comfort of the men. The cars, in keeping with the general color scheme, are painted chrome yellow on the outside, and present a very attractive appearance. The company supplies the steel bunks and mattresses. The food is the best that can be purchased and is well cooked. This camp can well be classed among the camp trains de-luxe.

Product That Removes All Odors

The supreme test of the efficiency of any disinfectant is that it does its work thoroughly, satisfactorily and quickly, leaving no trace whatever of any odor and making the atmosphere sweet and wholesome. Such a product has been discovered in Rosealene, the worth and merit of which are widely recognized. It is not only a perfect disinfectant, but a deodorant as well and is employed with the most gratifying results in all classes of buildings and surroundings. It effectively destroys the strongest odors and its use ensures perfect cleanliness and sanitation. All germs are promptly killed and there is no unpleasant aftermath in its use.

One of the strongest features of Rosealene is that it does not suppress odors by substituting another possibly more vile. Its superiority is attested in the fact that its use leaves absolutely no odor. A Canadian product manufactured from the highest grades of chemicals obtainable, it not only kills vermin, germs and odors of all kinds—no matter how pungent or stale—but it is an excellent antiseptic for cuts, burns and wounds. Its use is harmless and the fumes are non-poisonous. Rosealene will keep any odor suppressed many times longer than any other disinfectant. For the cook house, bunkhouse,

stables and office premises of lumbering firms, the manufacturers state that it never fails as an antiseptic insecticide and germicide, being stainless, colorless and harmless, and all users are speedily convinced that this preparation is in a class by itself. It is manufactured by Rosealene Products, Limited, 145 Wellington Street West, Toronto. The number of repeat orders is a tribute to the esteem and confidence which Rosealene enjoys, for thereby is its genuineness attested and its pre-eminence established.

The Lumberjack Can Go "Over the Top"

Lieut. William O'Hara, a widely known baseball player and a native of Toronto, who went through the battles of the Somme, Vimy Ridge and Ypres with the 24th Canadians, says that the lumberjack is the greatest fighter of all at the front. In somewhat picturesque language, Lieut. O'Hara in a recent interview in a New York paper paid the following tribute to the sturdy Canadian woodsmen now overseas:—

"The 24th outlasted and outstayed every outfit in the front-line trenches. You want to know why? I'll tell you. Sixty per cent. of my outfit is made up of lumberjacks. There's the answer.

"Athletes? Shucks! Say, you know I was something of an athlete. At least that is what the papers used to call us when I played with the New York Giants. But if you want to see a real athlete just make goo-goo eyes at the next lumberjack you see.

"Ah, they're the athletes for you, tougher than hickory, hard as nails, and wiry as a bronco. A lumberjack may not be able to run 100 yards in ten seconds or bust the old ball out of the lot. The only reason he can't, however, is because he is not trained to it.

"But when it comes to the big game over on the French front, say, Bo, there's where Mr. Lumberjack becomes captain of the varsity! He'll outhike, outfright, outdog, outlast any athlete that ever got a headline on the sporting page. After living three weeks in ice water up to his neck on the spring logging drive, what is the cold, the mud, and the damp of the trenches to him? What are the labors of digging in to a guy who has been rassling big pine and spruce butts ever since he was knee-high to a grasshopper?

"He'll march thirty miles with a regulation kit on his back and do a backwoods breakdown at the end. His lungs will stand a gassing that would send the soul of an ordinary man on the long trek. When the rations run low he'll live on stuff that wouldn't keep a chipmunk alive and only draw his belt up a couple of notches and cuss the King to hades and back. Yet the next minute he'll joy in going over the top and giving his ornery life 'For King and Country.'

"Fight? Say, a lumberjack would rather fight than eat! You ought to have seen some of those woodsmen at Wipers and Vimy Ridge! The only way to stop 'em was to kill 'em, and if a cat has nine lives a lumberjack has nineteen. There's no way of killing a lumberjack except to blow him to smithereens. A wallop that would knock the ordinary man grovelling in the blood and mire of No Man's Land will only send the average Shanty Boy on the faster.

"I remember when we went over the top at Wipers. Next to me a fellow had his left arm taken off at the elbow clean as a whistle by a piece of shrapnel. It gouged a piece out of his side, too. Did he stop, lay down, and wait for the stretcher-bearers to get up to him? No, siree-e! Biting at that poor, bleeding stump like a wild animal he waved his rifle aloft with his good arm and plunged on, roaring: 'I'll get you for this!' Say, that fightin' backwoodsman wanted to get his revenge out of the whole German army!"

Patriotic lumberjacks are willingly observing meatless and wheatless days, and doing without sugar and milk twice a day, Secretary J. A. Vye, of the Minnesota Food Administration, told timber operators at the close of a timber sale at St. Paul. The operators pledged co-operation to the food conservation movement in every possible way. In one big camp, Secretary Vye said, the Hoover plans are resulting in a saving of 6,000 pounds of sugar weekly and other food conservation. And all that, he said, should prompt city people to give greater co-operation. With A. D. Wilson, state food administrator, Mr. Vye will go into the lumber camps again to urge further food conservation.

The Largest Spruce Cut-up Plant

The largest cut-up lumber mill in the world is located at Vancouver Barracks, just across the river from Portland, Oregon. The main building of the plant is 349 x 400 feet, and the shipping sheds 60 x 500 feet. The output capacity is from 400,000 to 600,000 feet of airplane stock sizes every twenty four hours, with three or four shifts of men, totalling about a thousand men. The maximum cutting length for timbers is 40 feet. Each unit of the plant contains two circular saw rigs, one right and one left, carrying 48-inch No. 9 gauge saws. The carriages are three and four block type. Back of the saw rigs are two table edgers, two re-saws and eight trim saws in each of the six units. It is expected that dry-kiln facilities for about fifty per cent. of the output will be installed, requiring a boiler capacity of 1,500 h.p. The entire plant is electrically driven and every safeguard against accidents is given the workmen. The arrangement of the plant provides for the installation of two locomotive cranes running parallel to the unloading track for the easy and convenient handling of cants from the railroad cars to the transfer cars, operated by gravity into the mill. The outgoing loading track is at the rear of the plant. The locomotive cranes also are used to pile up cants alongside the railroad tracks before they are carried to the mill for resawing. Electric cranes

The spruce cut-up mill at Vancouver Barracks, Portland, Oregon.

pile up the cants, while a system of conveyors under the floor transfers the refuse to the fireroom, where it is used for generating the steam for the dry-kilns.

The plant is equipped with 12 pony carriages, which are calculated to give it a daily capacity of 600,000 feet. It is protected by a double line of guards and a great battery of searchlights.

A considerable supply of hewn, sawed and rived cants are already on the ground and more are arriving each day. The plant will be operated on a 24-hour basis, with four crews working six hours at a shift with 12 hours off.

Crossgrain has been one of the chief causes for rejection of airplane material at the Eastern factories. Elimination of crossgrain has therefore been one of the problems. All logs have some taper, and by beginning to saw at the butt end in the usual way you cut across the annular rings, which are parallel to the bark. In order to cut straight grain lumber it is necessary to start at the butt end, cutting say, two inches in and then come out at a depth of two inches at the other end of the log. This produces straight grain. This method is not necessary to obtain commercial stock, but the stress which falls upon airplane material makes it absolutely vital that this lumber be sawed to get actual straight-grain stock. This plan must be followed in order to get straight-grain lumber from the mills for the re-manufacturing plant.

At the Vancouver plant the lumber will arrive in the form of flitches four and six inches thick. These will first be surfaced one side by the planers. The grain will thus be brought out clearly, and especially it will then be possible to detect spiral grain, which cannot be passed under any circumstances. With the grain now plainly visible, the next step is the marking of the piece for resawing, which will be done to eliminate all defective portions. The material will then be airplane parts in the rough. The next step is the kiln drying. The material will all be classed as to size in going to the kilns, the larger pieces, which require more time in the kilns being segregated from the smaller, which will dry faster. Beam stock will take about twelve days, and smaller parts seven days. It is probable that a small testing laboratory will be maintained to insure the material has not lost its strength in drying. Cross and spiral graining are the most treacherous defects that can exist in airplane lumber.

When present plans are completed there will be added an immense lumber kiln drying plant. Specifications call for equipment that will handle between eight and ten million feet of lumber a month. The type known as the Tiemann kiln is to be used in making four batteries of ten kilns each.

The Lumber Outlook in the South

Alex. Greig, of Greig, Morris and Blair, Toronto, recently returned from an extended business trip to the southern states, where he completed contracts with a group of mills to handle their entire output of lumber for the coming season. The firm will open an office in Mobile, Ala., which will be in charge of A. J. Morris. Mr. Greig reports that the prices for southern pine are stiffening and that stocks are not abnormal. The United States Government is taking large quantities of the production. In regard to hardwoods, it looks as if they will be scarce, due to the congestion in transportation, and the great difficulty in securing labor. The car situation has improved but little, and, owing to the shortage of help, some plants are able to operate only to about one-third or one-half of their capacity. Prices on southern hardwoods are, on the whole, well maintained. Mr. Greig, while away, was successful in closing a number of important sales.

"Cause You the Utmost Astonishment"

H. W. Lightfoot, of H. W. Lightfoot & Company, Liverpool, Eng., writes the "Canada Lumberman" as follows:—"In your issue of February 1st, under the heading of 'This May Bring the Check,' you give a suggested letter for the collection of 'well nigh impossible accounts'."

"Honestly, I do not think much of the suggested letter. It does not seem to me calculated to fetch anything much. Might I give you two alternative suggestions?"

"First, as to an Englishman who was employed to collect accounts and went about it in this way: He wrote several letters to a certain firm, which produced nothing. He then summed them up thus:—

"We wrote you on the 1st inst. No reply. We wrote you on the 5th inst. No reply. We wrote you on the 10th inst. No reply. This is bloody. Yours truly."

"The second alternative, which was eminently successful, developed thus:—

"Shortly after the Russo-Japanese war a Jap came to London seeking work. He applied to a certain firm and they asked him what he could do. He said he could do almost anything.

"Can you collect accounts?"

"Oh, yes, I am a dab hand at that work."

"So they started him on the job and they gave him one firm to apply to from whom they had been unsuccessfully trying for a long time to get money. The Jap started in on the work and by return of post the money came. The cashier was astonished and most interested to know by what process it was obtained, so he asked the Jap to let him see the application he made. It turned out to be as follows:—

"We write you on several recent dates requesting the payment of your account. This is to give you notice unless we have the amount by return mail we will take such steps as will cause you the utmost astonishment."

"This debtor had been in the habit of receiving definite threats, such as 'We will place it in the hands of our solicitors,' 'the issue of a writ,' etc., which were all to him the usual course and more or less definite, but this threat about steps which were to 'cause him the utmost astonishment' was something new to him and rather than face the unknown he paid up at once."

J. D. McArthur, president of the Edmonton and Dunvegan Railway Company, was in Vancouver recently, conferring with Major Austin Taylor, director of spruce supplies in British Columbia. Mr. McArthur holds a large tract of timber in the north on which there is a considerable quantity of spruce suitable for airplane construction. It is probable that he will dispose of this property to the government, having received a reasonable offer for the purchase of the timber.

No Interruption to Business

An item in the April 1st issue of the "Canada Lumberman" regarding a fire at the plant of the Thurston-Flavelle Lumber Company, Port Moody, B.C., contained incorrect information. The sawmill was not burned or even damaged, the fire being confined to two shingle dry kilns. We learn that these were rebuilt and in operation again within two weeks, and that the output of shingles was in no way interfered with, the company having two well-equipped shingle plants. There was no interruption to business, and orders were filled in the same prompt manner as heretofore.

Quebec Men Stop All Free Delivery

Charge is Now Made Separately from the Price of the Lumber—New Plan Has Worked Out Admirably—Better Selling Terms Arranged by Co-operative Action

By J. O. Chalifour, Quebec, Que.

The year 1917 was a quiet one for the retail lumber dealers of Quebec city so far as the amount of business was concerned. Fortunately most of the retailers had a pretty good stock at the beginning of the year and profited by the increase in the price of lumber.

The closing of the Ross rifle factory early in the spring of 1917 was to a great extent responsible for the falling off that was immediately noticed in the building trade. This factory was the most important one in Quebec, giving employment to some three thousand men. Many of these employees left the city immediately after the closing of the plant and thus numerous dwelling houses were without occupants. A number of these houses had been erected at the request of the proprietors of the Ross rifle factory, who about a year before the shut down, claimed they had contracts offered them to give employment to four or five thousand men if the latter could find the necessary residences in the city.

Another reason for the inactivity of the building trade was the lack of money. For good reasons many were afraid of the future and would not consider any investment except in first class bonds or similar securities. There were so many favorable opportunities in this line for those who had means, that one could not be surprised at the fact that there was not a great deal of capital left for the disposal of the builder.

How Get-Together Plan Started

However dull 1917 may be considered the retail lumbermen will undoubtedly regard it as a good year in a number of respects owing to the get-together movement which was started by the leading dealers of the city.

Early in 1917—which means about the time that the usual inventory and closing of the books reveal the result of annual operations—the writer called upon the leading retailers of Quebec and inquired if they were satisfied with conditions; if they wished any improvement in methods, and if they had any complaints they wanted dealt with, etc. The response to these inquiries was in most cases not satisfactory, as the dealers stated that the net profit realized in the majority of instances represented an interest of only four to six per cent. on capital invested. The general grievance was that credit was the cause of too many heavy losses and that it was being extended by the retail lumbermen to many contractors who offered no security at all.

The two most desired reforms were the elimination of bad debts and the discontinuance of free delivery. In order to work successfully toward the achievement of both ends it was proposed that all the retailers join together and form an association that would facilitate the carrying out of these improvements. Thus an opportunity was presented for the consideration and discussion of many matters of mutual interest to the dealer, and steps taken to improve the conditions of the retail yard owner.

The leading retailers of the city met a few weeks later and, after

some exchange of views, a constitution and by-laws were drawn up and the following officers elected:—President, L. C. Marquis; vice-president, Napoleon Gignac; secretary, J. O. Chalifour; treasurer, P. L. O. Gagnon. Directors, J. H. Gignac, Joseph Lefrancois and Louis Hamel.

Six meetings were held during the year and all the members are confident and anxious in the belief that most desirable improvements have been effected through the work of the Association.

The Reforms Which Were Effected

The first reform proposed—the discontinuance of free delivery—was carried out most successfully and all parties concerned are a unit in voicing the expression that such a step was both advisable and opportune. Every one that pauses a moment and considers past conditions now admits that they were anything but ideal. In fact, they were inadequate in every respect.

Let us take the time when every dealer claimed that he delivered his lumber free of charge to any part of the city. Free delivery cost some retailers as much as \$8,000 a year and others \$6,000, and so on, according to the importance and proportions of their respective businesses.

When we consider these figures it is almost impossible to believe that this service was given free. No, it could not possibly be so and an amount varying from fifty cents to one dollar was added by every retail lumber dealer to the price of every thousand feet he sold in order to cover the cost of delivery. Thus, if a retailer added seventy-five cents for every thousand feet, b.m., of lumber to provide for the expense of delivery, a customer who bought 1,500 feet, which was sent in one load, paid for his delivery at the rate of \$1.13 per load, which was too much.

On the other hand, if a person came for ten boards and wanted them delivered one, two or three miles, the lumber dealer was realizing on this small consignment a profit of about fifteen cents and paying for delivery an average of seventy-five cents and, therefore, he sustained a loss every time of about sixty cents. The retailer sometimes did not pay much attention to this because there might be one of his teams in the yard doing nothing and he did not stop to think whether working or not, the team cost him the same at the end of the week.

How the Proposition Works Out

Let us suppose, for instance, that I am a lumber dealer who has no teams of my own and whenever I have any delivery to make I telephone a carter to have the job attended to. Do you think that if I am offered a sale on which I will realize a profit of fifteen cents and have to pay seventy-five cents to one dollar to a carter to deliver the same, I will be willing to make such a sale? No, I will tell the prospective buyer: "Look here, the lumber you want is worth \$1.50, and if you agree to pay that much for it it is yours. Now if you want

L. C. Marquis, President.

Nap. Gignac, Vice-President.

J. O. Chalifour, Secretary.

OFFICERS OF QUEBEC CITY RETAIL LUMBER DEALERS' ASSOCIATION

this lumber transported from my yard to your house, it will cost you seventy-five cents more. Glve us this amount or get your own team to do the work. If you have none you will have to hire a team, for you cannot expect that any dealer can do the delivery for nothing."

Before the delivery was charged separate from the price of the lumber, or in other words, at the rate of so much per thousand feet, too many of our customers were abusing the supposed free privilege. For example, a man would start some repairs and would not have any definite figures regarding the quantity of lumber that he would require. He would telephone for a few pieces that he wanted to start with and keep on telephoning every time he noticed he needed a few scantling, a few extra feet of moulding or some ten or fifteen boards. I remember having made five trips to the same place in the same day and each time with very small lots.

The New Terms and Cartage Charges

Today every customer does his best to have his lumber sent up in one load as far as it is possible to do so and thereby a great saving is effected, which is of advantage to both the dealer and the customer.

In the office of every member of our Association, the following sign now hangs in sight:

Our Terms are Cash!

Except for well known and highly responsible parties, to whom we extend the following credit: Two per cent, 10 days or 30 days net from date our monthly account is rendered.

Tariff of Cartage:

We the undersigned make the delivery of our lumber and other material we sell, within the city limits at the following rate:

A one horse load or part thereof \$0.75

A two horse load or part thereof 1.25

J. H. Gignac, Ltd., Napoleon Gignac, O. Chalifour Reg'd, E. T. Nesbitt, Reg'd, Joseph Lefrancois, J. B. O. Gagnon, L. Canac Marquis.

Lumbermen Confer on Stop-Over Rates

A meeting of representative lumbermen was held recently in the offices of the Canadian Manufacturers' Association, Toronto, for the purpose of giving further consideration to the stop-over service and the proposed increase in rates. It is understood that the railways, who proposed to restrict the arrangement to planing, resawing and sorting, have agreed to continue the service without cutting off any of the privileges which have prevailed. In regard to raising the charge from one to two cents per hundred pounds, the lumbermen agreed that this would work a hardship to many small mills and the connections generally that had been built up in and around transit dressing. There is considerable shipment of dressed Southern pine and Michigan hemlock which enters Canada and comes in competition with the home trade. For this and other reasons the charge, it is contended, should not be augmented.

This movement in regard to lumber from the other side coming into the Dominion is on much the same lines as lumber from Canada entering the United States market where Canadian millmen have to meet the stop-over regulations and charge of United States planing mills. There is thus a parallel in conditions and to meet the advanced rates, as proposed by the railways, it is submitted, that there should be no charge in the present tariff.

No definite decision has been arrived at yet, but it is probable an amicable adjustment on this disputed question between the lumbermen and the transportation companies may be reached in a few days, without the matter coming before the Dominion Railway Commission.

Wood as an Emergency Fuel

At the first general professional meeting of the Canadian Society of Civil Engineers, held in Toronto recently, E. J. Zavitz, provincial forester for Ontario, gave an interesting and timely address on "Wood as an Emergency Fuel." He stated that the woodlands of Southern Ontario would not replace coal to any appreciable degree, and in a large number of cases counties have less wood than those in the Old Country and the thickly populated sections of the United States. Many counties in Ontario have only five per cent. of their area covered with inferior wood, while several eastern states have fifteen and twenty per cent. well wooded.

Educational systems such as the government now proposes should have been instituted years ago and the extravagant waste of wood in rural communities stopped. Some districts, such as Brant and Oxford, are just as dependent on coal as the large cities. The large belt of hardwoods in Ontario lies between North Bay and Ottawa, and further north the woods are principally resinous. If the cities require hardwoods it is from the district indicated that it would have to be brought. The simplest method for a community to secure wood would be to let contracts to local contractors for wood delivered to the sidings and ready for shipment.

The calorific value of wood varies directly as its weight; thus, a cord of white oak weighs approximately 4,000 pounds, and is equivalent to one ton of anthracite coal, and a cord of spruce or pine weighs in the neighborhood of 2,000 pounds, and is equivalent to one-half ton of coal. The principal hardwoods available for fuel are maple and birch, which weigh between 3,000 and 3,500 pounds to the cord. Dry wood is very much better and more efficient than green wood which contains at least 25 per cent. moisture. This water requires heat to be evaporated, which passes up the flues. The wood that has not yet been cut will lack fuel value. Winnipeg has laid in 50,000 cords of tamarac which will replace 35,000 tons of coal. The principle to impress upon the consumers is not that so many cords of wood will replace so many tons of coal, but to teach them the economic use of wood.

Mr. Booth Passes Ninety-First Milestone

Mr. John R. Booth, of Ottawa, celebrated his ninety-first birthday on April 5th—by working. This is how the great Canadian lumberman, paper manufacturer, and captain of industry has observed each natal anniversary and all other days during the sixty-one years that he has resided in the Capital. It was just ten years prior to Confederation that Mr. Booth landed in Ottawa with nine dollars in his pocket and went to work for eighty cents a day. He is still

active and enjoying good health. His friends confidently predict that he will cross the century mark going strong, and directing his vast enterprises as energetically and aggressively as ever. Mr. Booth is the largest timber limit-holder in Canada.

An Abundance of Fuel Predicted

According to the statement of the president of a leading Pennsylvania coal company, who recently visited Toronto, the people of Canada have seen the last of the heatless days so far as the supply of coal is concerned, not only for the present season, but for many to come. This will be welcome news to every industry. The same authority stated that there was an abundance of fuel in sight, and one might as well predict there would be no bread next year or no wheat as to venture the assertion that there would be a dearth of coal. The glad tidings was also conveyed that the authorities at Washington, together with the railway administrators and different coal associations, have agreed upon a new plan for the distribution of coal to the various markets to which it has heretofore been delivered. This new arrangement will enable the railways to deliver the dusky diamonds to the consumer and get the cars back to the mines in the shortest possible time, the idea being to send the coal to the market nearest to the field where produced.

Nelson John Vannier, who was widely known in the lumbering industry in Ontario and British Columbia, passed away recently in Vancouver, at the residence of his daughter, Mrs. Routhier. Mr. Vannier, who was in his eighty-fourth year, had been for 55 years with the Cowichan Lumber Company, spending his early days with the logging camps around Bobcaygeon, Ont. Many years ago he left Ontario for British Columbia, and until 1908 was engaged as cruiser for the Cowichan Company.

Doings of the Trade in the East

H. C. Heans, St. John, N.B.

Harry C. Heans, manager of the Dunfield Lumber Company for New Brunswick, with headquarters at St. John, which were recently opened up, is widely and worthily known in the trade. Previous to assuming his present connection, Mr. Heans was for eleven years with the firm of Geo. McKean Company, Limited, and prior to that with R. C. Elkin, ship broker. During the last six years that he was with the McKean Company, Mr. Heans was buyer for them in New Brunswick and Maine.

The Dunfield Company, with whom he is now associated, handled about 75,000,000 feet of lumber last year and report that business from their St. John office is progressing very satisfactorily. Dunfield and Company handle beech, birch, maple, spruce deals,

etc., and do a big export business to Great Britain, France and the United States.

The firm have more than twenty-five mills to draw from and as exporters and dealers in all kinds of lumber have built up a wide name and reputation for themselves. During the past year they were one of the largest exporters of lumber in Nova Scotia.

That the lumber cut in Nova Scotia will be brought down this season twenty-five per cent. below normal was the statement made recently by Tupper Warren, a prominent lumber operator of Digby, N.S. He said that he has had no trouble securing labor to carry on work. With reference to his cut, he said, that while shipbuilding in the province accounted for a considerable portion, it did not take millions of feet to meet the demand. The latter industry was making vast strides in his province.

J. S. Richards, of New York, was in St. John, N.B., recently, in the interests of W. Whitmer & Sons, of Philadelphia. He purchased a large supply of lumber for building operations in the United States.

Views of representative lumbermen regarding the proposed Workmen's Compensation Act were laid before the New Brunswick Government on April 4. They maintained that the bill was a dangerous one and unfair to employers of labor. They objected to sections including all branches of the lumbering business. So far as the manufacturing part of their business went they were ready to agree, but the logging, driving and booming were not manufacturing, but producing of raw material. They said it would be touching the operators four times. J. Fraser Gregory, of St. John, N.B., said that the lumbermen had formed an association and are stronger and more enthusiastic regarding measures of self defence than ever before. He added that the lumbermen had made and unmade governments and they could do it again.

An interesting session took place in the New Brunswick Legislature on April 4 before the corporations committee, when consideration was given to a bill to create a board of commissioners for the Nipisiguit River in Gloucester County, N.B. It was strenuously opposed by the Gloucester Lumber Company, whose representative, Peter J. Hughes, contended that the purpose of the bill was to get control of the river for the Bathurst Lumber Company, as the bill provided that rights on the river should go according to the quantity of lumber brought down stream, and the Bathurst Lumber Company drove 40,000,000 feet, and the Gloucester Company 6,000,000.

The bill was supported by George Gilbert, solicitor for the Bathurst Lumber Company, who outlined its chief provisions. The object of the bill is to create a commission of five members elected by those driving logs in the river on the basis of one vote for each thousand feet driven. The commission would have power to spend money to improve driving conditions and recoup itself by assessments on the lumber driven. One improvement proposed was the erection of a dam at a place called the Narrows for the purpose of maintaining a water supply in the river when the logs are going through. J. P. Lordon, foreman for the Bathurst Lumber Company, said that there was urgent need for a dam. He added that the Gloucester Company had opposed every plan for improving the river. It was suggested that the parties get together and try and reach an agreement.

Randolph & Baker, owners of one of the largest sawmills in New Brunswick, which is situated at Randolph, a short distance from the city of St. John, have purchased the entire lumber industry and holdings of the firm of G. & G. Flewelling, Limited, of Hampton, N.B.

G. & G. Flewelling, Limited, has been identified with the lumber industry of the province since the year 1862, when they established their sawmill at Perry Point, and the property is considered a valuable one. It has not yet been stated whether Randolph & Baker will operate the Flewelling plant the same as the original owners, or just when operations will commence.

George Macdonald, of New Glasgow, N.S., who was visiting lumber dealers in New Brunswick, has just completed a tour of inspection of the mills along the North Shore. With reference to his inspection he said he found everything agog in the lumber districts in preparation for the opening of the season's operations.

Lumber mills along the St. John River are making preparations for resuming operations. Advices from St. John are to the effect that they will start just as soon as they can get their logs out of South Bay, where they are in the booms. It is said that Stetson, Cutler & Company's large mills will be one of the first to start.

Lumber merchants throughout the province are interested in the sale of the Miller sawmill and lime kilns, which are situated near St. John. They are to be put up for public auction.

Brief News Notes from Ottawa

The trade and business name familiar to Canadian lumber dealers and woodworking plants and purchasers as the "Estate of James Davidson" has ceased to exist, because Flight Lieut. Kieth, youngest son of the late Controller James Davidson, a founder and operator of one of the biggest woodworking plants in Canada, has attained his majority and in early April returned to Ottawa on furlough.

Henceforth the plant, covering approximately a city block, will be known under the trade name as "James Davidson's Sons." With the return of the young Flight Lieutenant the trustees who have administered the estate since the father's death, have been abolished and the business, property and the whole large estate has passed to the two sons, Grant and Kieth.

Lieut. Kieth, however, is not going to take active part in the lumber business immediately, as he will return shortly to the Royal Flying Corps to strafe the Boches. In his absence the workings of the factory and mill will be looked after by Mr. Grant P. Davidson. According to the will of the deceased former owner each son receives a half interest in the business. Kieth Davidson's return on furlough to Ottawa was in connection with the transacting of important business in the winding up of the estate.

The new sulphite mill erected by John R. Booth at the Chaudiere is expected to open about May 1st. The capacity is rated at fifty-five tons daily.

John G. Poupore, only son of the late W. J. Poupore, lumberman and ex-M.P. for the County of Pontiac, died recently in an Ottawa hospital. The deceased for many years was a partner of W. J. Poupore, contractors, but retired in 1900, going to Dawson City, Yukon. He was well known in Ottawa and throughout the Ottawa Valley, and is survived by two sisters, Mrs. (Judge) St. Julien and Mrs. H. B. Thomson, of Ottawa. The funeral was held from the residence of a brother-in-law, at Westmount, Que.

Sawmakers in Bowling Tournament

"Some of the game's best friends are found in substantial organizations which realize the game's real worth," says the "Bowler's Journal," of Chicago. Therefore the announcement that the Simonds Saw Companies, manufacturers of saws and machine knives, are to stage an inter-company tournament is hailed with acclaim and noted with more than ordinary interest. These companies have been identified at Chicago in bowling circles for the past eight years through membership in such leagues as the West Side Business Men's, Southwest, Monroe, Simonds, Southwest Industrial and Commercial, in which last named a team bearing the name is now rolling at the Monroe house of Bensinger. This tournament will be held at Buffalo, N.Y., April 19 and 20, and two teams will represent each of the Simonds factories, which are located at Fitchburg, Mass.; Montreal, Que.; Lockport, N.Y.; and Chicago, Ill. The winning team will be presented with the Olson trophy at a banquet to be held at Buffalo, following the close of the tournament. The Montreal team are composed of big-leaguers, having won the city championship of that metropolis in 1915, 1916 and 1917, and expect to settle for once and all their claim to the championship honors of the company. However, it is to be stated that they are going to meet with some good competition, and before they are through they will know that they have been contesting in a real tournament.

"There are possibly thirty or forty leagues in Chicago, composed of houses representing various large industrial enterprises, with each league representing some one special line of manufacturing, yet the Simonds people are the first to give recognition to a distant point to take part in competition for the championship of the company."

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Making Waste Products Pay

The difference between success and failure in many instances may be in the use of what are generally regarded as waste products. It was only a few days ago that a practical commercial chemist of Philadelphia made mention of the fact that a certain factory in that district, engaged on war contracts, was letting a usable by-product run down the sewer to the extent of some fifty or sixty barrels a week. A proposition was made to him that the waste would be bought for a dollar a barrel, but as he wanted more and the prospective purchaser could offer no more the material is still being washed down the sewers.

There is a prodigal waste spirit which occasionally shows itself and which should be discouraged, if America is to win this war and is to be equipped for competition with the world after the war. Chicago stockyards have been proud of the reputation for using everything of the pig but the squeal, and the same principle must be applied by American manufacturers to every commodity on the list if the nation is to hold its ground. The last by-product should be squeezed from every pound of soft coal which we mine, the last drop of acid extracted from every bit of waste fume sent up by the smelters, the last grain of potash precipitated from the dust of cement mills.

There are not little things when it comes to industrial development and industrial expansion.

Review of Current Trade Conditions

Ontario

There are no startling developments in the general lumber situation as far as conditions in Ontario are concerned. The chief sources of interest are the probable date of the resumption of activities by the various mills, the sales of the outputs for the coming season, and the high figures which this year's wood crop is commanding. It is not expected that very many mills will begin operations before the end of the month as there is not sufficient logs to ensure more than a few days' cutting. However, with the advent of mild weather, supplies are being secured and there is every likelihood that a good season's business will be done, although a number of organizations will not operate all their plants, due principally to the decimated cut of logs and the shortage of labor. The mills are advertising as never before to secure help and labor is rather independent and exacting in its attitude. Some big sales of white pine, red pine and spruce logs have been reported at a very heavy increase over last year's quotations. It is understood that one Ontario concern disposed of several million feet of white pine logs at over \$39 per thousand feet, while red pine brought \$34 and spruce \$35. These are possibly the highest figures ever obtained in the trade.

The car situation is improving considerably,—in fact the railways have in a number of instances dumped more cars in yards than could possibly be unloaded with any degree of promptitude. Some of these have been sent back to the consignors. Shipments of lumber across the border are moving forward with a great deal more facility, and while transportation is by no means ideal, still, the past month has brought such improvement over the previous three months, that any measure of relief is greatly appreciated. At the meeting of the National Wholesale Lumber Dealers' Association, held recently in New York, at which a number of Canadians were present, a resolution was passed asking the United States Government to release all Canadian cars held on the American lines and to send them back with all possible speed.

Building operations are spasmodic. In certain centres they have taken a spurt, but in the smaller towns plans, which have been well in hand are held up, owing to the uncertainty of the news at the front. If more favorable tidings from the theatre of war were received, it is thought that many projects would be proceeded with. There has been a decided jump in western fir and other lines, owing to the advance in freight rates, the new rate being 73.4c as against the old tariff of 67c from the Coast. The eight-hour day and the recent increase in the price of logs have sent values of B. C. timber skywards. It is expected that when the new freight rate is confirmed, figures on B. C. stuff will be even higher.

In hardwoods it is reported that the cut for 1917 has been pretty well sold up even at the advanced cost of 35 to 50 per cent. There was a tendency to hold back at first, but dry stock is very scarce and not nearly the quantity desired is available. It is believed the markets for hardwoods will be very firm during the coming season. It appears that there is no great production in sight and during the last few days there was considerable scurrying to close contracts for the season's cut. It is stated that the cost of production is nearly 40 per cent. over a year ago.

In pine, spruce and hemlock, very few contracts have been closed for the coming season. It is reported that the mills are not very anxious to sell, or the wholesalers at all inclined to pay the augmented figures. Generally speaking, the new list shows that pine has advanced \$10 to \$12, spruce \$6 to \$8 and hemlock \$4 to \$6. In some cases wholesalers have considerable stocks to dispose of yet. Owing to the rather uncertain status regarding the war, there is a disposition on the part of the purchasers to sit tight, and in the meantime mills are not worrying about the sale of their cut. In no instance will it be equal to last year, and it is believed there is everything to gain and little to lose by awaiting developments and a more settled state of the markets. On all sides it is the unanimous verdict that prices on every kind of lumber will go higher before the end of the summer and the advances this spring have not been equal to the added cost of production so manufacturers contend.

Great Britain

Reports from Liverpool are to the effect that the values of hardwoods are high but an opinion prevails that unless something unforeseen occurs, there is not much likelihood of quotations going much higher. Larger shipments of supplies in imported hardwood have been coming forward but there is no certainty regarding a regular and

constant source of supply. Indications are that there will be a further decrease in the consignments of timber, according to English advices, owing to further restrictions in shipping, the trouble in obtaining export licenses and that more tonnage is being required by the government for transport services. There is no need, however, to take a pessimistic view. In connection with timber operations the "Timber Trades Journal" in a recent issue says:—

For the last two years or so the ring of the axe of our Colonial lumbermen has been much heard in our woods and forests, and at the moment the Canadians are beginning to fell 600 acres of oak and larch at Wythop Wood, Bassenthwaite Lake, which was last felled in its entirety at the time of the Armada. The value of our wood has been borne in upon us, and this deforestation, combined with the fact that trees, like mortals, can get sick and die, that epidemics can rage among them and ravage whole tracts of woods, has resulted in the springing into existence of a new profession—that of the "three doctor."

For home grown timber there is a fair demand, and the main factor which militates against the extension of the business is the shortage of labor. After the war a much brighter outlook is anticipated for all kinds of the home grown variety, especially in view of the shortage of imported woods. The demand is much better than the supply. Trade reports from Glasgow say that available stocks are now at their lowest ebb and that the opening of the season in the province of Quebec being close at hand, the prospects for shipping are still very uncertain, although it is quite possible that certain schemes, which are meeting with the Controller's consideration at the present time, may, if adopted, do something towards relieving the stringency of the existing situation. It is ardently to be hoped that something tangible will result, as, although merchants and sawmillers are now, for the most part, actively engaged in the exploitation of the home woods, the business is proving anything but satisfactory to them. It certainly demands an amount of care and attention far from being commensurate with the results obtained. Many complaints are to be heard as regards quality and measurement of deliveries, and, if one can believe all one hears, the method of dealing in the home wood trade is in many instances much too loose. It is, perhaps, too much to expect anything else in times like these, when there has been an influx into the trade of so many rank outsiders, lured by the prospects of big profits, whose knowledge of the trade is no knowledge, and who are nothing more or less than "birds of passage," out to make the most they possibly can on their short flight.

A little further contracting business has been arranged for Quebec pine deals on an f.o.b. basis, but so far as can be learned no spruce fixtures have taken place. There is very little spruce offering, and shippers are displaying no anxiety to make sales. Several pressing inquiries for yellow pine deals have been on the market of late, and have had, for the most part, to go unsatisfied. One or two merchants still hold, it is true, small quantities in stock, but these are of an almost negligible nature, and are being reserved for regular retail customers' requirements. One or two small parcels of spruce deals have come forward lately, and were easily sold at full maximum prices, but one lot was sent on to England, after being offered round the market at a high figure.

United States

With the betterment in the car and log supply there is considerable improvement in the condition of hardwoods. The shipping situation has improved a good deal and in the South, considerable anxiety is experienced lest worms may eat the logs piled on sidings, and strenuous efforts are being made to get these logs to the mills. There is considerable speculation on the part of the dealers as to whether the recent announcement regarding the application of softwood prices to indirect government needs is to be extended to the hardwood end of the industry, but as yet no information of an authoritative character is forthcoming. The government has fixed the price of fir up to and including May 31st. The price for fir logs is also fixed.

That the maximum price for fir logs in the Pacific Northwest, delivered at the points where it has been customary to make delivery to the sawmill operators, be fixed at \$19 a thousand for No. 1 logs, \$15.50 a thousand for No. 2 logs and \$10 a thousand for No. 3 logs, scale as to grade and contents to be determined according to the methods that have been customary in the various districts for the last four or five years. These prices are a basis for logs up to and including 40 feet in length. Logs over 40 feet in length to be priced

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

on the same basis for extra lengths as has heretofore been established by custom. In no case shall any greater price than that mentioned above be allowed for logs of those grades during the period of March 19 to May 31, 1918.

The price fixing committee of the War Industries Board also passed a ruling on the prices of fir lumber as follows:

That the price of fir ship timbers under the Ferris schedule to the Emergency Fleet Corporation be readjusted at item prices that will average \$40 a thousand for a complete schedule for both the rough and dressed items, and that all sales of lumber for other vessels under government contract requiring a schedule of lumber of similar type shall be furnished at not to exceed the same basis of prices.

That the prices of fir lumber for aircraft use, to both the United States Government and its allies, remain the same as those now in effect (March 19, 1918).

That the prices of all other items of fir lumber remain the same as those enumerated in a certain list of the Douglas Fir Emergency Bureau, effective between the dates of December 1, 1917, and March 1, 1918, to all other departments of the government, be continued in effect to May 31, 1918.

Prices named on West Coast Lumber Association's yellow sheet bearing date December 1, 1917, covering timbers 34 feet and longer shall be cancelled, and a price of \$6 a thousand over west Coast price list of May 1, 1915, hereby is made effective for timbers of above lengths until May 31, 1918. Prices on items not covered by above lists shall be priced on basis of nearest comparable item. It is understood that during this time the loggers and lumber manufacturers will not reduce the scale of wages now being paid.

The demand for white pine is good and has been stimulated by an excellent publicity campaign in which many retailers have reaped the benefit. Prices are very firm and the chief difficulty is to get cars to make shipment. With respect to southern pine there is a

very keen demand and buying by retailers is increasing. It looks as if the demand will be pretty active in many sections and some improvement in the car situation is noticed.

For the week ended March 29 a group of 141 mills booked orders for 117,220,971 feet, shipped 91,238,175 feet and produced 80,565,826 feet. Normal production is estimated at 99,000,000 feet. Thus orders booked were almost 19 per cent. greater than normal production and represented the largest total booked so far this year in a week.

Many of the mills making Douglas fir have reached the point where it is impossible to store more lumber, and every effort is being made to move the side cuts as rapidly as possible, and unless something is done in this direction, a number of plants may be forced to shut down. Referring to the industry on the Pacific Coast, the "American Lumberman" says it is divided into two divisions, one division being logging and the other lumber manufacturing. While the price of lumber for government needs was reduced even in the face of the eight-hour day the prices of logs were fixed for the first time. Thus it may be that the lumbermen will not be in any worse shape, but that the burden will have to be borne by the loggers. The prices as fixed by the government for fir logs are \$10, \$15.50 and \$19. The car situation is so serious that it seems probable that the government will be forced to give relief. For the week ended March 23 a group of 139 mills report that actual production was 75,161,129 feet, as compared with normal production of 101,900,000 feet. Orders were booked with much care, as the mills do not wish to enter into contracts until the car situation shows some signs of improving. Consequently new business booked was small, being for 10,557,699 feet less than actual production. Shipments were slightly in excess of orders, being 6,900,537 feet less than actual production. Rail orders were above rail shipments 2,340,000 feet, leaving the mills 12,685 carloads of unfilled orders on hand. Prices are firm and give every evidence of so remaining.

HOME AND ABROAD**

Conditions are Brightening at Ottawa

The Ottawa lumber market for the first ten days of April showed an improvement over the opening period of March, and also as compared with the corresponding period last year. High prices and the increased demand (principally foreign) created an apparently better market than a year ago.

A variety of happenings, chief of which were, the incoming of spring weather, prospects of an early opening of navigation, an abundance of orders, together with a betterment in the car and embargo situations, caused an optimistic outlook. While the surface elements tended toward improvement, lumbermen, especially the manufacturers, were not overly elated by them.

The manufacturers gave serious thought to the expected labor crisis which they believe may evidence itself when the sawmills start running. With their usual farsightedness some of the manufacturers are taking into account the prospect of a great shortage of labor for bush operations next year.

Prices for the first ten days showed no change over March quotations. The market continued decidedly firm. Orders and inquiries were plentiful. The domestic demand showed some improvement. An advance in price on all grades, and especially dry stock, was expected. The market was not overstocked, and stocks of dry lumber were low. There was not as much unsold stock on hand as at a corresponding period a year ago.

Manufacturers, it is reported, have come out in the open and are giving more definite quotations for the 1918 sawing. The advance over last year's prices ranges from thirty-three and one-third per cent. to around fifty per cent. Some dealers state that it is a question if they will be able to replace the stocks they sold in March and early April without a considerable increase in price. More kiln drying is being done this spring than in former years to offset the shortage of dry stocks.

The Imperial Munitions Board, the trade expected, would grant further large orders for shell boxes about April 12th to 15th. The placing of these orders with woodworking plants in the Ottawa district would seem an increased demand for dry stock, which would likely be followed by a sharp advance in price. The contracts will be for two-round 6-inch boxes.

Rail transportation improved somewhat with some of the mills. Reports from the trade were to the effect that the railway companies were doing everything they could to provide rolling stock for lumber

shipments. There are millions of feet at Ottawa Valley mills awaiting shipment. The transportation department of the Imperial Munitions Board is helping to facilitate the movement of stocks for war purposes in Canada. A plant manufacturing shell boxes desiring stock purchases it, and, if cars are not available to the shipper the transportation department is notified. It then communicates with the railways, who in turn give the Board preference in the distribution of available cars. The Board has nothing to do with foreign shipments nor has it any control over foreign cars on Canadian lines.

More cars were available due to the open weather and their number was added to by railways giving sanction to lumber shippers to use gondola coal cars to carry rough lumber to the United States. Formerly such cars returned empty. Congestion at terminal points in the United States was believed by shippers to be one of the biggest causes in delaying lumber shipments. The opening of navigation is expected to considerably relieve such a situation.

Embargoes at American points were easier than during March. Destinations along the Atlantic seaboard caused the chief difficulty. Westward of this zone embargoes caused less trouble.

Stocks in New York yards, it is said, are about depleted, and the demand on the yards continued heavy for certain grades. American buyers showed more activity, but exhibited apprehension before closing orders as to the time of delivery. They desired if immediate shipment was not possible by rail that the lumber be loaded on the first barges to operate when navigation opened.

The lumber outlook remained unsettled and very hard to gauge with any certainty. Some mills and woodworking plants have been advertising since the first of the month for mill men, with the result that staffs in the latter are more or less constantly changing. With the opening of the sawmills, it is expected that the woodworking plants will be hard hit, especially those having large shell box orders to complete. Since the last report the manufacturers have looked further than having enough labor to operate their sawmills. Such labor is a great deal shorter than last year, and serious apprehension is being expressed as to where the men are going to come from to get out next season's wood cut. The announcement of the Military Service Council indicating that Category "B" men are to be called to the colors makes the outlook for woods labor still worse for next season.

Judging from the market condition and outlook in early April a well-informed lumberman held the view that if dealers had suffi-

The Only Milk You Need in the Camp

Klim supplies all milk needs for Lumber Camps—and saves money, transportation charges, storage room and labor.

Klim is pasteurized, separated milk in powder form. It is made by separating the butter fat from pure Ontario milk and reducing the remaining body-building food value, casein, albumen, milk sugar and salts of milk to powder form by removing the 87½ per cent. water content of the original milk.

When dissolved in water according to directions, it makes a liquid with the natural milk taste.

Klim is a Wartime Economy.

Klim is economical. It costs less per gallon than any other form of milk. It bulks small—weighs light—saves 50 per cent. to 75 per cent. of freight bills on your milk supply. It keeps sweet and fresh until all used. There is no spoiling and wasting through changes in temperature.

In a word—Klim is pure, wholesome, convenient and economical. Use it and save money.

It is "the regular milk" used daily in the Lumber Camps of Canada. Your cooks probably know Klim. Add it to your list of supplies.

The Log Jack for Heavy Work

New Double Powered Log Jack

The above illustration gives a correct idea of our new Double Power Log Jack, designed for hauling heavy timber into Saw Mills.

GEAR.—The large Gear Wheel is 36 in. in diameter, with 72 teeth, 4 in. face, and 1½ in. pitch.

PINION on intermediate Shaft has 13 teeth, 4 in. face and 1½ in. pitch.

PAPER FRICTION is 10 in. in diameter and 10 in. face. Iron Friction Pulley is 30 in. in diameter and 10 in. face.

CHAIN is made of extra heavy steel, and the bunks have steel spikes, the whole outfit being calculated for heavy logs.

cient capital to carry dry stock through from the fall of 1918 to the spring of 1919 that they would coin money.

McAuliffe-Davis Lumber Company reported an improvement in the car situation, and a shortage of dry stock, with stocks lower than a year ago. Mr. A. M. Davis said labor was getting restless and gangs were floating from one place to another. Despite interruptions by new employees coming and going fairly good progress was made on the large shell box order.

James Davidson's Sons also experienced trouble with mill labor though it was not serious. Since the completion of the large shell box order the plant has been running on commercial boxes, for which there was a good demand at fair prices. Activity in the sash and door trade showed a little improvement over March.

The Rideau Lumber Company reported both domestic and foreign orders as being good. Some improvement was noted in the car and embargo situations. Mr. Dougherty stated that congestion at American terminals was, he thought, one of the chief factors in preventing stocks moving more freely.

J. Oliver and Sons reported good progress being made on their shell box order and the market for furniture firm. Furniture was in good demand.

The Fraser-Bryson Lumber Company state that manufacturers had come out in the open with quotations for the 1918 sawing. The advances quoted ranged from thirty-three to fifty per cent., the higher advances being on grades of spruce. Domestic and foreign orders were reported as continuing good.

Gilmour and Company characterized the outlook for spring business as good, with labor as the disquieting feature of the otherwise optimistic outlook. In view of the impending shortage of labor this company thought it quite possible that the production of the sawmills would be lessened. An increased demand for hardwoods was noted. A sharp advance in the price of spruce, box board and mill culls was expected. Mr. Belford said that although pine was selling about \$10 per thousand above last year's prices and in spruce further increases ranging from thirty-three and one-third to forty-five per cent. might be looked for. "If you have cars for shipment you can sell anything you have," he stated. Best end spruce used chiefly for aeroplanes was reported scarce. In this connection a buyer quoted a short time ago at \$42 per thousand thought the quotation too high. He returned a little later and paid \$75 per thousand for the same grade.

Jackson Booth reported that John R. Booth could not tell exactly what the advance in the manufacturers' prices to the wholesalers would be, as the firm had not yet been able to ascertain their up-river costs and determine what amount of labor would be available for operating the sawmill.

Mr. P. C. Walker, of Shepard and Morse, reported dry stocks low except on grades of good strips and sidings. Shipments of wood "greener" than usual were reaching the market. Labor was reported scarce. Shepard and Morse are making a spring cut and drive.

Montreal Reports Improved Conditions

The recent improvement in business is maintained, both for local and United States account. There has also been a welcome alleviation of the transportation situation, although much remains to be done before conditions get back to normal. The worst spot is the shipping of lumber to the United States. Inquiries from over the border are very numerous, especially for box lumber, but the lack of transportation facilities has seriously interfered with trade. Besides this, dry stock is very scarce. Firms who have any suitable lumber at convenient shipping points are able to sell at exceptionally good prices.

Quotations are as strong as ever, the general view being that the peak has not yet been reached.

Local trade is better. The building permits for last month are nothing to boast about, but a fair quantity of new construction work is coming out, including sheds for the Imperial Munitions Board, churches and schools. During March the permits totalled \$241,660, a decrease of \$112,200; while the total for the first quarter of the year was \$434,815, a falling off of \$561,105.

Orders for B. C. lumber are still on the slow side, but there has been a strengthening of values, the mills having again put up their prices, consequent on a good demand from the United States. A further advance is not unlikely.

Exporters to the United Kingdom are still in the dark as to probable shipments. The steamship companies are not in a position to say anything definite as to what, if any, space will be available, but the chances are that only government orders will have any chance of being shipped.

Miss Aletha Gertrude Carter, only daughter of Walter W. Carter, of Toronto, president of the Fesserton Timber Company, died recently. Besides her father, three brothers, all of whom are connected with the company, are left to mourn her loss.

Local Business Opening Up at St. John

The warmer weather at St. John, N.B., has to some extent opened up a certain amount of local business, and the future shows some possibilities which may result in an improvement. It is said that T. McAvity & Sons will build a larger machine shop or munition plant than the one they already have at Rothesay Avenue. The Booth Fisheries will also erect a new sardine works at West St. John, while there are some other large projects which, within a few days, may come on the market. They will run into many thousands of dollars. The factories are fairly busy, and it is to be hoped that if men for the shops can be found, the plants will be kept busy during the summer season.

The sawmills are now getting under way. Messrs. Stetson, Cutler & Company and Murray & Gregory, Limited, began sawing some days since. At the present moment the tone of the American market is firmer than two weeks ago, and buyers are offering prices nearer to the ideas of the manufacturers than at any time since last fall. No sales for season's cuts have yet taken place at St. John, but the merchants who have lumber to offer are standing out firmly, and claim that unless they get the price they are asking the business will be unprofitable. Bank logs cut by farmers are selling from \$15 to \$18 per thousand right through for very inferior logs. This is the highest ever known, but as there are very few offering the figure will have very little effect. Logs from further up the St. John River will no doubt cost a large percentage over these prices, but the material is much better, and larger and longer specifications can be produced from the spruce logs than farmer logs cut nearer the city.

It is said that the United States Government have many orders to fill and have, it is reported, purchased considerable stocks on this side of the line at very high prices.

Lath and shingles are selling at around last season's prices, and no change is anticipated. Stocks are very small at St. John and will have little effect on the market.

Importance of Welfare Work in Camps

It is proposed by the Reading Camp Association, which for seventeen years has been carrying on educational experiments in lumber and other camps, with a view to providing night schools that a letter be sent to Hon. Dr. Pyne, Minister of Education, to the effect that the work of the association has always been discounted owing to the fact that it was without authority in the camps.

The communication then goes on to say that "for years employers of frontier labor regarded the work on hand, such as lumbering, construction, etc., to be the sole object of their operations. When the Reading Camp Association started its work, over seventeen years ago, many laughed; others were openly hostile. Some merely tolerated our instructors, either because they were good workmen as well as good teachers, or because they found from experience that their employees liked the entertainment, reading matter, and instruction provided, and were less likely to jump camp. Not a few, we are glad to say, co-operated cordially from the beginning. Recently it would appear that the social consciousness of employers has been, we think, fully awakened to the importance of welfare work at their camps.

"We earnestly request that the following legislation be passed:

"That the employer report to the Education Department, as he does to the Board of Health, on the establishment of each camp, giving a list of camps and the location of each, the name of the foreman in each, the means of access to camp, average number of men in each camp, number of non-naturalized men in each camp, name and certificate of the teacher engaged, date of the contract for work in camp and its duration.

"That the employer provide a suitable room for a night school and equip it with desks, a blackboard, etc.

"That every non-naturalized employee be required to attend for two hours—7 to 9 o'clock—each night for five nights in the week.

"That the Education Department prepare a curriculum by which the alien will be taught English and civics.

"That the Education Department supply books, etc., for the students, and pay for the same from government funds.

"That a truant officer be engaged and paid by the Education Department.

"That a government inspector be appointed and paid by the government.

"That said inspector visit each camp at least once a session and report to the department.

"That the board of trustees be composed of the president of the company, the manager, and the government inspector.

"That the expense incurred be borne by taxes levied on the employer and a poll tax collected from the employee as is done in the case of the Board of Health."

The Dominion Wood & Lumber Company, Limited, have increased their capital stock from \$250,000 to \$500,000.

HIGH SPEED PLANER & MATCHER TYPE A4

DEPENDABLE

DEPENDABILITY is built into the Type A-4. It is a part of every gear, every casting and every bearing. The A-4 has heavy cast-in-one piece base and separate infeed table, therefore you can depend on its vibrationless construction and high class output. Bed line is proper distance from floor. All parts "get-at-able." No ladder needed to make adjustments. Feed rates up to 200 feet per minute. All control levers and hand wheels convenient to operator. And you can also depend on this—

IT IS A LABOR-SAVER AND A PROFIT-PRODUCER

We have prepared a comprehensive six-page circular on this machine, which explains and illustrates the A-4 in detail. Ask us for a copy. It's free, and imposes no obligations.

Lumber Wholesalers Want Better Merchandising

War condition emphasize the need of better merchandizing methods and an improved credit system. This was the keynote of the twenty-sixth annual convention of the National Wholesale Lumber Dealers' Association held in New York on March 27 and 28. There was a thorough and earnest discussion on terms of sale and the adoption of trade acceptance as a means for making liquid the various open accounts which it has been said are "the bane of the industry."

The membership in the association is 409, and in the bureau of information 249, which is the largest in the history of the organization. There was an expressed determination on the part of the delegates to bring about desired business improvements and united action to do their full duty in the present emergency of winning the war.

Horace F. Taylor, of Buffalo, was elected president for the coming year, succeeding M. E. Priesch, of North Tonawanda, N.Y., who gave a stirring address in which he said that the past year had presented the greatest problems and handicaps to business ever experienced. Notwithstanding this the lumber trade as a whole had prospered.

Secretary E. E. Perry, in his report, said that with the readjustments in manufacturing, transporting and merchandising our products there is also the financial end to be considered, and with the widening out of our Federal banking system there has come the proposition of swinging the lumber business into the trade acceptance plan of financing. The lumber business has in the last fifty years built up its own method of settlement and we are not all clear as yet on the subject of the trade acceptance. Undoubtedly it can be used profitably and practically by both seller and buyer and may be especially desirable just now on the new high price basis which is requiring the use of more capital all along the line. Some of our members now use trade acceptances with satisfaction, others have taken the "bull by the horn," utterly ignoring any discussions and make the terms practically on a cash basis, while others are still at sea and use "any old terms." Many think that as a war measure in the present crisis we should join together forthwith and announce firmly that for the supreme reason hereafter all sales of lumber for the period of the war must be closed on the basis of either cash or trade acceptance. Competent legal authority has ruled that such concurrent action is not subject to penalties under the Sherman Law.

Co-operation between our association and the retail association is constantly increasing on a more practical basis, thereby becoming more helpful each year. Probably our greatest co-operative work has been in connection with railroad transportation matters, but we also constantly act as arbitrator in business transactions and are always willing to give our services when we can be of help.

In a report of the Committee on Lake Marine, which was presented by Chairman Andrew Brady, of Buffalo, he stated:—

The rate of carrying lumber on the lakes during the season of 1917 was the highest we have any record of, we think the highest in the history of the business, and our forecast for the season of 1918 is that the rate will be much higher than in 1917.

The following are some of the reasons for the high rate: In the first place, the number of boats operating in the lumber trade in 1917 was much less than in previous years, some of them having entered the coast trade and others the coal carrying business. In the second place, we believe one of the most important factors in causing the sharp advance in rates was the general raise in wages. The boats in the lumber trade pay for the loading and unloading of the lumber. The wages of the lumber handlers at both ends of the route advanced about fifty per cent. The wages of the crews on the boats, from the captain down, also advanced in the same proportion. The coal consumed by the steam boats advanced more than fifty per cent. over the previous year. All these factors combined are responsible for the advance in freight. The marine insurance remained the same as in previous years.

Among the Canadians who attended the twenty-sixth annual meeting of the National Wholesale Lumber Dealers' Association in New York and were present at the association banquet, were Messrs. W. Gerard Power, River Ouelle, P.Q., president of the Canadian Lumbermen's Association; A. E. Clark, of Toronto, chairman of the Wholesale Lumber Dealers' Association; C. W. Wilkinson, of the Union Lumber Company, Toronto; E. H. Lemay, Montreal; W. F. Fillion, of E. H. Lemay, Montreal; D. C. Johnston, Union Lumber Company, Toronto; Gordon C. Edwards, Ottawa (who was re-elected a trustee); D. G. Gilmour, Ottawa; Mr. Eagen, Hawkesbury Lumber Company, Hawkesbury; A. H. Campbell, Campbell-McLaurin Lumber Company, Montreal; P. D. Gordon, Mason, Gordon and Company, Montreal; Mayno Davis, McAuliffe-Davis Lumber Company, Ottawa; D. McLachlin, Arnprior; Frank Hawkins, secretary of the Canadian Lumbermen's Association, Ottawa; John Levy, of W. & J. Sharples, Quebec; Hon. W. C. Edwards, Ottawa; Angus McLean, Bathurst Lumber Company, Bathurst, N.B.; W. D. Lummis, Toronto; S. C. Thompson, of W. C. Edwards & Company, Ottawa; Mr. Morrison, Price Bros., Quebec; John McLeod, R. Laidlaw Lumber Company,

Tonawanda, N.Y.; W. B. Blair, H. Blair, Louis Rolland, Montreal; Mr. McCarrow, River Ouelle, Que.; J. S. Gillies, Braeside, Ont., and others. Many of the Canadians were accompanied by their wives, and all report having had a very pleasant time.

W. Gerard Power made a brief speech as President of the Canadian Lumbermen's Association.

A resolution was passed asking the United States Government to release all Canadian cars held on the American lines, and to send them back with all possible speed.

The Retailers' Association entertained all the delegates at a luncheon on the 27th, and also at a theatre party on the evening of the same date.

National Association Convention Postponed

The sixteenth annual meeting of the National Lumber Manufacturers' Association, which was to have been held in Chicago, Ill., on April 8 and 9, has been postponed by the Executive Committee to Tuesday and Wednesday, May 7 and 8, when the gathering will take place in the Congress Hotel. The postponement was rendered necessary owing to the fact that a number of officers and directors of the association and of affiliated bodies found it inconvenient or impossible to be present on the date originally named.

Will Erect Mill in Port Arthur

John Stirrett and Sons, wholesale and retail lumber dealers, of Port Arthur, Ont., whose yards and planing mill are on Central Ave., intend erecting a sawmill in Port Arthur on a site which has been granted to them by the city at the foot of Manitou Street on the lake front, providing the firm comply with certain conditions. These are that the land is not to be used as a piling ground, that the lumber is to be immediately removed and that provision is made for a dumping ground for refuse from the plants. It is understood that the mill will be quite a large one and that construction work will start in the near future.

Personal Paragraphs of Interest

J. A. Laberge, of the Laberge Lumber Company, of Sudbury, Ont., is spending a few weeks at Atlantic City.

Walter C. Laidlaw, of the R. Laidlaw Lumber Company, Toronto, returned lately from a few weeks' stay in South Carolina.

A. C. Manbert, of the Canadian General Lumber Company, Toronto, and wife, have been in the south for the past month.

W. D. Lummis, Toronto, accompanied by his wife and daughter, returned home lately after enjoying a visit to the southern states.

Mrs. Ingleby, mother of Charles E. Ingleby, president of the Ingleby-Taylor Company, Brantford, passed away in that city recently.

Duncan McLaren, of the Union Lumber Company, Toronto, and wife, have returned after a holiday at Sea Breeze, Fla., and other points in the south.

George H. Holt, of the Holt Timber Company, Chicago, who has been spending several weeks in California, was in Toronto recently on business and left again for the south.

Alex. Gordon, of the Callendar Saw Mills Company, Callendar, Ont., accompanied by his wife and son, who spent some weeks at Sea Breeze, Fla., returned to Toronto recently.

W. Gerard Power, president of the Canadian Lumbermen's Association, River Ouelle, P.Q., and C. W. Wilkinson, of the Union Lumber Company, Toronto, with their wives spent several weeks in Cuba, Florida and Louisiana, returned at the beginning of the month, thoroughly well pleased with their trip. Messrs. Power and Wilkinson paid a visit to the offices of the Southern Pine Association in New Orleans, and speak in the highest terms of the efficiency and enterprise of this organization, which is doing such effective work in the interests of its members.

Every Good Citizen Deputy Fire Ranger

The danger season for forest fires is near at hand. Rapidly drying soil has left the old grass, brush, leaves, etc., in most perilous condition for starting fires. An effort is being made by the fire rangers to keep down the forest losses this year to a minimum. They will succeed only if every camper carefully extinguishes his camp fire before leaving it, if every smoker refrains from tossing away burnt matches or tobacco in or near a wood, and if settlers in the newly-opened districts guard their land-clearing fires with the utmost care. Settlers' fires continue to be the very worst source of forest conflagration, although campers and careless smokers are close competitors.

"The fire rangers," says the Canadian Forestry Association, "want every good citizen to regard himself as a deputy ranger from now until November first."

Holds Premier Position as Roof Covering

The Superior Points of the Wooden Shingle Far Outweigh Any Defects—Properly Kiln Dried Shingle is the Best of All Looking at it from Any Viewpoint

Ever since the invention of the shingle it has had its uses and abuses, its upholders and detractors. The denunciators of the shingle are not alone confined to the small boy who has felt its effects when wielded in mother's hand, but, naturally, it is being assailed by manufacturers of patent roofing of all kinds. Notwithstanding the encroachment of substitute materials, the shingle stands to-day in wider demand than ever. It has not been seriously displaced by the other roofing materials that have been brought to the fore and sold under strong guarantees. There is no doubt, everything considered, that the wooden shingle is the best, cheapest, and most easily laid roofing material of the present day. It is probably as safe, economical, and durable as any patent production with a high-sounding name. There have been fires innumerable, but too many of these have been charged up against the shingle when the latter was not guilty. All fires do not originate on roofs, as some would lead the unthinking to believe. In fact, such fires are only a small percentage of the total number, and in rural districts the menace from flying embers is remote.

In a recent address before the National Lumber Manufacturers' Association the statement was made by a leading speaker that fire protective associations, insurance men, and the manufacturers of competitive materials were the opponents of the use of the wooden shingle, and, outside of the last named, some of the objections were honest and sincere. It was pointed out during the meeting that even where the most rigid fire zones exist competent tests prove that shingles can be so treated as to be sufficiently fire resistant to eliminate them from the list of igneous hazards. Upon the results of such tests, he declared, depended to a very large extent the future of the wooden shingles in the towns and cities of the United States.

One of the greatest enemies of the wooden shingles is nails, and particularly the ordinary wire nail. This was emphasized by Mr. J. S. Williams, secretary of the West Coast Lumbermen's Association, Seattle, Wash., who asserted that wire nails have been more largely responsible for giving wooden shingles a black eye than any other enemy; and, if he could drive home to retailers one thought; it would be that of refusing to sell wire shingle nails to anyone for the purpose of laying shingles. Zinc coated nails, pure iron or copper nails can be used, but never wire nails. Although the former may cost a little more than the latter, what does it matter in the life of a roof. "One stitch in time saves nine" is a favorite axiom, and one or two holes in a roof may do all kinds of damage. It is important that dealers should handle only good shingles, and in this connection the points raised by Mr. Williams at the late Winnipeg gathering are of so striking and forcible a character that a summary of them is herewith reproduced:

Inherently, Western red cedar has no peer in point of durability. Mighty giant cedars have lain in the forests of the West Coast for centuries without showing the least signs of decay. Cypress may be its equal in durability, but certainly not its superior. So in its natural condition we all think of red cedar as "rot proof."

The Shortcomings of Some Manufacturers

It is extremely unfortunate, however, that, given this grand wood, some manufacturers so poorly manufacture it into shingles. You know what these shortcomings are—you have seen the rough, butted and fuzzy surfaced shingles; you have all seen shingles with big checks and shakes, due to improper dry kilning; thick shingles packed with thin; shingles off parallel, etc. Poor manufacture, and nothing else, is responsible for such defects as these. Rough butted shingles are due almost altogether to dull or improperly filed saws; rough surfaced shingles to the same reason. Occasionally, however, you will find shingles rough on one side and smooth on the other. Such roughness is not a manufactured defect, but is due to the grain of the wood; but roughness on both sides is inexcusable.

You hear a great deal about whether a green shingle, an air-dried shingle, or a kiln-dried shingle is the best. The idea is prevalent that because the old, old roofs we see were covered with green shingles they are the best. We hear that kiln-dried shingles do not have a very long life, so some of you dealers buy air-dried shingles, to save freight over green ones.

Now, this is the truth about the matter: A properly kiln-dried shingle is the best of all, looking at it from any viewpoint. But let me emphasize that one word "properly." An improperly kiln-dried shingle is the worst of all. And right here lies the difference. If, the moment a shingle is placed in the kiln it starts drying, the outside of the shingle becomes dry long before there is any change in temperature or moisture content of the inside of the shingle. The outside "case-hardens,"

and to drive the moisture from the inside of the shingle it is necessary to "break through" the outside wood in order to dry the centre of the shingle. This breaking-through process is what makes the checks and shakes you have seen in shingles. Moreover, there are thousands of little checks that are not visible to the naked eye, but which are nevertheless a defect.

Now, if when shingles are placed in the kiln live moist steam is admitted, no drying whatsoever takes place. The temperature of the kiln, however, rises rapidly. When properly kiln-drying shingles, when this temperature reaches a certain point, say, 180 degrees F., it is held at this point until the heat has had a chance to penetrate to the centre of the shingle. Then the moisture content of the kiln is gradually reduced, abetted by a proper circulation of air, and the shingle starts drying—not from the outside in, but from the centre of the shingle toward the outside—the outside being the last to dry. Such a system in no way checks a shingle—does not drive off any of the cedar oils that prolong the life of a shingle also, and the product is in the very best possible shape. It is a fact, too (though not known to nearly all of the manufacturers), that it does not take nearly so long to properly kiln-dry a shingle as it does to improperly dry it. But these are things that the manufacturer is rapidly becoming wise to.

Now, you have all seen the "dark brown streaks" in cedar shingles, and the most of you think they are rot streaks. You are right and you are wrong. These streaks are caused by a fungus by the name of "Polyporus schweinetzii," which lives on the sap found in the wood, and the dark brown color is caused by a secretion given off by the fungus. But when such shingles go through the dry kiln Mr. Fungus dies completely; not only does it kill him, but it changes his food to a form that he cannot eat. Mechanical tests have proven that shingles having these dark brown streaks are just as strong as the others, and their durability is absolutely unaffected. In other words, the dry-kilning gives you a sanitary shingle, and, when properly seasoned, the very best shingle obtainable.

Driving Home Some Hard, Cold Facts

The wooden shingle has another enemy—nails—the common garden variety of ordinary wire nails. Wire nails, I honestly believe, have been more largely responsible for giving wood shingles a black eye than any other thing. If I were a retail dealer I would make it so almighty hard for a customer of mine to get wire shingle nails that he would never be tempted by their low price. And galvanized wire nails are but little better. Four years—five years—possibly six years—and a sufficient number of the nails have rusted out to cause leaks in the roof, and the farmer or home-owner gives wood shingles the devil, when he should have given you the devil for selling him wire nails. Use zinc-coated nails, pure iron nails, or copper nails, but never wire nails. What does \$2 or \$3 amount to in the difference of cost of nails if by spending this amount you can prolong the life of a roof for twenty or twenty-five years? If I could get you retailers to take home just this one idea with you of refusing to sell wire shingle nails, I would feel that I had had a mighty successful trip to your convention.

Now, I don't know how much of a hold the patent roofing people are getting in your territory, but it's a safe bet that if they are not already busy they soon will be, making a mighty keen bid for business. And, when they do, they usually get a part of what they go after. Now, how do you receive the propositions of the patent roofing manufacturers? On the basis of progressive advertising and up-to-date merchandizing methods it certainly would be to your advantage to push patent roofing products. But on the basis of satisfaction to the customer (if you intend staying in the lumber business) you can't afford to sell patent roofings for other than flat roofs of purely temporary construction. I know that the code of ethics of your association would not be other than telling the truth about your products, and the truth is all in favor of Western red cedar shingles.

The shingle branch of the West Coast Lumbermen's Association is composed of the more progressive mills of British Columbia, Washington, and Oregon. What we are doing and what we propose to do more strenuously in the future is to co-operatively advertise, standardize, and merchandize Western red cedar shingles. We maintain an inspection bureau, employing a corps of shingle experts whose duty it is to see that everything is correct and as advertised, and invite all persons to notify us when they know of an inaccurate statement being made about our goods or those of any other roofing material, and in this way we keep the truth always before the public.

YOUR opportunity in Wood Pulp

Every Canadian Saw Mill or Plant could profitably take advantage of this opportunity. By installing an inexpensive Kraft Soda Mill, all the slabs, tops, bottoms and waste wood may be utilized to produce Wood Pulp. We can place long term contracts for all that Canadian concerns are able to supply. The Swedish supply is practically cut off and Canada has a free field for this business. We will be pleased to send you details of this opportunity.

Past Winter Trying One in the Woods

Ed. Littleton, of the R. Laidlaw Lumber Company, Toronto, returned recently after spending several weeks along the north shore and other points in the Ontario hinterland. He states that the lumbermen found the past winter one of the most difficult to carry on woods operations that they ever experienced. The extremely cold weather, frequent falls of snow and heavy drifts blocking the roads make progress in getting out the timber very slow. One large firm owing to the sudden thaw this spring were unable to get 15,000 pieces to the streams and the logs will have to remain on the skidways until next year, while another firm has a million feet of logs held up. Unless there come heavy rains this month, there will be difficulty in floating the timber. The snow thawed so quickly that the rivers poured more than an ordinary volume of water in the lakes, the water in several instances going out under the ice. Some of the lakes are rather late in breaking up; many plants will be delayed in starting operations owing to not having sufficient logs on hand. Mr. Littleton estimates that the cut during the past season was only seventy-five per cent. of the previous year.

Toronto Lumber Firm Becomes Incorporated

A provincial charter has been granted to Lauder, Spears and Howland, Limited, with head offices in Toronto, and a capital stock of \$150,000. The company are empowered to carry on a lumber, timber and pulpwood business and to manufacture lumber, logs and wood of all kinds. The firm of Lauder, Spears and Howland, which is composed of James Lauder, Joseph Spears and Lucien B. Howland, have been engaged in the lumber manufacturing and wholesale business in Toronto for the past five years under a registered partnership, and the securing of letters patent marks no change in the personnel of the organization. A well equipped sawmill was erected in 1917 by the firm at Pakesley, Ont., on the Sudbury branch of the C. P. R., and was operated for a few weeks last fall. It is expected that the new plant, which has a sawing capacity of 100,000 feet, b.m., a day, will start running about May 13.

The Men Behind the Lumber Organizations

The life and usefulness of any organization depends largely on the efficiency, initiative and executive ability of its secretary. An alert secretary stimulates the members along the line of activity and progress. These officials go about their duties quietly and with as little demonstration as possible but their energy, faithfulness and devotion to duty results in an association becoming increasingly valuable. Its worth and work extends, gathering strength and prestige with each succeeding year. In the selection of secretaries, the various bodies of lumbermen—manufacturers, wholesalers and retailers—have exercised wisdom and foresight and picked "the right man" for the job in every case.

In the May 1st issue of the "Canada Lumberman" will appear pictures of a number of gentlemen, who are secretaries, in either a permanent or honorary capacity, of the various bodies. The manner in which they look after the manifold duties of their respective offices is a tribute to their perseverance, enthusiasm and fidelity. Memberships are growing, finances are in good shape, important work is being undertaken and many propositions for the interest, welfare and improvement of the industry as a whole are directed with splendid co-operation and aggressiveness.

The Superiority of Wooden Trestles

That wooden trestles are much more economical than those of concrete is the decision arrived at by a committee of the American Railway Engineering Association after an exhaustive investigation. The report on wooden bridges and trestles, submitted to the recent convention of the association at the Coliseum in Chicago, says: "Creosoted timber trestles are more economical than concrete except when the cost of the concrete structure is less than one and one-half times the cost of the wooden structure."

Inasmuch as the compilation of comparative wholesale prices of all commodities recently issued by the Bureau of Labor Statistics of the United States Department of Commerce placed lumber at the very bottom of the materials whose prices have risen during the war, there is little likelihood of concrete wresting from creosoted timbers their supremacy as trestle building material.

Official notification has been received from Ottawa by the City Council of Quebec to the effect that no further contracts for wooden vessels will be granted to firms in that city.

Mr. Harry E. Bedard, lumber merchant, of Richmond, P.Q., died in the Western Hospital, Montreal, on March 17. He was the son of the late Mr. Joseph Bedard, ex-M.P.P., the business in Richmond being carried on under the name of Joseph Bedard & Fils.

Many Fires in Lumber Mills have been caused by Hot Boxes

This risk can be eliminated by the use of
Chapman Double Ball Bearings

EDGINGS

Ontario

The Cleveland-Sarnia sawmills at Sarnia, Ont., have resumed operations for the season.

The Holt Timber Company, Bolger, Ont., are in the market for a towing drum and 5/8 in. cable.

A federal charter has been granted to the Trenton Cooperage Mills, Ltd., of Trenton, Ont., with a capital stock of \$100,000.

J. E. Cutler Company, Ltd., who recently suffered loss by fire at Welland, Ont., are rebuilding their office and part of planing mill.

The Beaver-Abitibi Timber Company, Ltd., have been granted permission to increase their capital stock from \$300,000 to \$1,000,000.

The Dargan Lumber Company, Ltd., of which John Donogh is manager, have opened offices in the Bank of Hamilton Building, Toronto, as wholesale lumber merchants.

During the recent severe flood in Belleville the premises of the Pringle Company, who conduct a lumber yard and planing mill on the west side of the Moira River, were badly flooded. The boiler house of the company was considerably damaged.

The Bethune Pulp and Lumber Company, Ltd., Huntsville, Ont., have started work on their new sawmill and rossing plant. The sawmill will be built on the shore of Vernon Lake, with a capacity of 40,000 feet per day. The rossing plant will be erected for barking pulpwood. The Whiteside mill is being dismantled and part of the machinery used in the new one. The company was incorporated in October, 1917, with a capital of \$50,000.

Fire recently broke out in the Thor Iron and Shipbuilding Works, at the foot of Bathurst Street, Toronto, and caused damage to the extent of \$300,000. The heaviest loss was in plans, patterns, and blue prints of nine big lake boats. One steel freighter, on the stocks waiting for the ice to clear from the slip to allow of launching, was damaged. The boat is 260 feet long, and is intended for ocean service under the Canadian register. The company employ about 600 men, and have started rebuilding operations, which will be completed within a few weeks.

The Spruce Falls Pulp and Paper Company, of Toronto, who some weeks ago secured the right from the Ontario Government to cut pulpwood on the Kapuskasing limit, will soon start work on the erection of a one hundred ground wood pulp plant, which will cost one million dollars, with equipment, when completed. The Kapuskasing limit in Northern Ontario consists of 1,156,000 acres. The National Transcontinental Railroad runs from east to west through the forest, and the Kapuskasing River runs through the property from south to north. It has been figured out that the wood can be laid down at the mill door at a cost of between \$4.50 and \$5 per cord. The contract of the company with the Ontario Government states that the former agrees to spend \$1,000,000 in a ground wood pulp mill to manufacture daily 100 tons of pulp, to employ 200 hands, and not less than \$200,000 shall be spent in one year and not less than \$300,000 in the next two years.

Eastern Canada

Lapointe & Pilon, lumbermen, Montreal, P.Q., have dissolved.

The Dominion Pulp and Paper Securities Company, Ltd., Montreal, P.Q., have obtained a charter.

Fire recently destroyed the sawmill belonging to the Audet Sawmill Company, Black Lake, Que., near Sherbrooke. The loss is estimated at \$7,000.

Edmond Tremblay, care of Narcisse Fugere, Batiscan Station, P.Q., has purchased the sawmill belonging to Mr. Fugere, and proposes to make alterations to the machinery to manufacture wooden spools for thread.

The St. John Shipbuilding Company, Ltd., St. John, N.B., are contemplating the erection of a shipbuilding plant. Mr. Thomas Nagle is the manager and Mr. Frank D. Chase, Chicago, Mich., is the engineer, who is looking for a suitable site.

The Makamik Sawmill Company, Ltd., Makamik, P.Q., will rebuild their sawmill, which was recently destroyed by fire. The manager is Mr. M. N. Dumas. The building will be 1½ storeys, 90 x 30, frame construction, shingle roofing, spruce flooring.

Joseph Martin, St. David D'Yamaska, P.Q., recently suffered a serious loss by fire, in which his sawmill was totally destroyed. The loss is estimated at \$35,000. The plant will be rebuilt, and will require all new machinery; also round and band saw, log carrier, hay presses, wooden lathes, etc.

The mill of the Miner Lumber Company, at Rawdon, Que., was completely destroyed by fire recently. The plant was getting ready for spring operations, and about 50 men will be thrown out of employment. The loss is estimated between \$40,000 and \$50,000. No decision has yet been reached whether or not the company will rebuild. It is understood that not much lumber was lost in the blaze.

The Kipawa Fibre Company, Ltd., is the name of a new company promoted under the auspices of the Riordon Pulp and Paper Company, Montreal, for the manufacture of the highest grade of bleached sulphite pulp. It is proposed to erect mills and develop hydro-electric power at Temiskaming, 38 miles from Mattawa, P.Q. It is stated that the wood available in the district yields more pulp per cord than any other wood in Canada. There is about 20,000 square miles of timber land from which the company's supplies can be secured. The directors estimate that, including \$750,000 for working capital, the capital expenditure will be \$5,400,000, of which \$2,366,000 will be required for a mill to produce 100 tons of bleached sulphite pulp per day; \$650,000 for developing 7,200 h.p.; \$250,000 for a sawmill of 30,000,000 feet b.m. capacity, logging equipment, cottages, etc.; \$100,000 for town and mill sites; and \$500,000 for timber limits. The Riordon Company will be joint managers of the new enterprise, Mr. Charles Riordon being president, Mr. Carl Riordon vice-president and managing director and Mr. C. B. Thorne second vice-president and manager. It is estimated that a net profit of \$28 per ton will be earned on the output.

Western Canada

A. H. McLelland, lumberman, Letellier, Man., has been succeeded by the McLelland Lumber Company.

J. S. Deschamps, Rossland, B.C., has plans under way for the erection of a sawmill at Trail, B.C. (Sullivan Creek).

Plans are in progress for the erection of a cooperage factory at South Vancouver, B.C., by the Vancouver Cooperage Company, Vancouver, B.C. The site has not yet been decided upon.

The Douglas Fir Timber Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and a capital stock of \$25,000, to carry on business as timber merchants and sawmill proprietors.

The Edgcombe-Toombs Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and a capital stock of \$10,000, to carry on business as lumber and timber merchants and to manufacture and deal in lumber and timber of all kinds.

The Harrison Lake Logging Company, Ltd., has been incorporated, with capital stock of \$25,000, and head office New Westminster, B.C., to carry on business as box-makers, woodworkers, timber and lumber merchants, loggers, sawmill, shingle mill, pulp mill, and paper mill proprietors, etc.

The Highland Lumber Company, Ltd., has been incorporated, with head office at Duncan, B.C., and capital stock of \$25,000, to carry on business as lumber and timber merchants, sawmill owners, loggers, and to manufacture and deal in lumber, timber, shingles, sash, doors, portable houses, boxes, etc.

The Alberni Pacific Lumber Company, Ltd., has been incorporated, with capital stock of \$1,000,000 and head office at Vancouver, B.C., to carry on business as timber merchants, sawmill, and shingle mill owners, loggers, and to manufacture and deal in lumber, timber, shingles, lath, sash, doors, and portable houses.

The Lakelse Lumber Company, Ltd., has been incorporated, with head office at Prince Rupert, B.C., and capital stock of \$20,000, to carry on business as sawmill owners and operators, timber merchants and lumber and loggers, to buy, sell, prepare for market, manufacture, import, export, and deal in timber, logs, lumber, and wood of all kinds.

R. P. Shannon has recently bought out the interest of his former partner, J. A. Smith, in the Smith Shannon Lumber Company, Vancouver, B.C., and is continuing the business of this well-known firm under the name of the R. P. Shannon Lumber Company. The concern has been in the wholesale and manufacturing lumber business in Vancouver for eight years.

Shipbuilding will be active on the Fraser River and another big plant will be constructed at Ruskin, which is a few miles up the stream from New Westminster. The name of the new concern is the Standard Shipbuilding Company, and it has just successfully negotiated a contract with the Imperial Shipping Board for the construction of ten composite steamers, each of which will have a reinforced steel keelson and knees, instead of the natural wood knees of Douglas fir. The company controls 150,000,000 feet of the necessary ship timber close to the plant, and already a force of men is engaged in felling the trees.

Elsewhere in this issue will be found the announcement of Alberta Lumber Company, Ltd., Vancouver, B.C., one of the larger concerns at the coast, whose products have been tested out for long and have steadily gained in favor owing to the consistent quality of every shipment that is sent out. Readers will probably remember the destruction of the company's plan by a fire a few years ago. A larger and more modern mill now occupies the old site, the increased output of which will permit of regular shipments of British Columbia fir, timbers, flooring, ceiling, and interior and exterior finish to the trade in Ontario and the Maritime Provinces. The advertisement of the company appears on page seven.

Telegraph Trail, near Warwhoop, B.C., station, on the B.C.E.R., is the location for a new lumber mill of about 15,000 feet capacity. Mr. George Lovette has already commenced the building operations, and the spur at Warwhoop station will be extended to the mill site. The C.P.R. has contracted for the entire cut of the new plant, which will be used for car decking and framing at the shops in Montreal. A planer mill will be erected at the new siding by Charles W. Tait, and will be under the management of Mr. Leavette. Messrs. Tait and Leavette purchased a considerable amount of lumber from small mills along the line which are not equipped with planers, and this lumber will be shipped to Warwhoop to be dressed before being sent east.

A recent despatch from Washington says that a general increase in the size of all ships built was ordered recently by the shipping board. Wooden vessels hereafter will be 5,000 tons instead of 3,500 tons. The more economical operation of large ships was the deciding factor in making the change. The American shipbuilders have been called upon to explain why their output for March fell behind schedule.

Fire recently destroyed the sawmill and factory belonging to the D. H. Gillies Company, 288 Adelaide Street, London, Ont. The loss on the sawmill and showcase works is estimated at \$25,000.

The employment of negro women in and about the sawmills of the South is one of the oddities resulting from the entrance of the United States into the world-wide war, the entrance having created a shortage of male labor that is being severely felt. One of the last places where it was ever expected that female labor would be employed was in sawmills, the work being arduous. The first experiment with negro labor about sawmills was made in Arkansas, and it resulted in so much satisfaction that the larger operations in the South have and are taking similar interest in that form of help. Two millwork plants in the South are employing none but white women workers, but all the others are using only the colored women, and according to reports, they are giving as much satisfaction as the average colored man. The Great Southern Lumber Company, Bogalusa, La., some time ago experimented with women labor, and it proved so satisfactory they are now using them as fast as the opportunity presents.

"By-Pass" Blower Systems for green saw dust and wet stringy material

Material that usually clogs the ordinary Blower is handled easily and continuously by our "By-Pass" Blowers. No material passes through or around the fan. That is the big secret of "By-Pass" success. Slow speed and minimum power are other strong features. Write for literature and all details.

We manufacture and install complete systems

Toronto Blower Company

156 Duke St., Toronto

Kendall Gang Circular

The Machine that will convert your small logs into more and better lumber, quicker than ever before.

The illustration shows one of the latest designs of gang circular patented by Mr. I. N. Kendall, the well-known millwright, of Ottawa. This machine takes 16-26 in. diam., 10 gauge saws—will cut cants up to 8 inches in thickness, and we furnish with it necessary saw collars for any thickness of lumber desired. It has a hollow mandrel, water cooled saws; each saw has a separate guide; easily accessible and readily adjustable, and the bridge tree is so designed that it can be removed, the saws taken off and a new set put on in 7 to 10 minutes. Safety fingers hung just inside the front press roll prevent a cant flying back off the saws. Lumber cut on these machines is guaranteed to come out absolutely true to size from end to end, and so smooth that 1/16 in. over size is all the allowance necessary for finish.

Read what one user says about it:—

"The machine has given every satisfaction and in many cases far exceeded my idea of sawing lumber; the proof of this being that our customers are paying me \$1.00 to \$1.50 per thousand more for certain classes of lumber than they can purchase same quality elsewhere—this advantage being purely on account of the uniform and smooth sawing this saw is capable of doing."

We are the original manufacturers of these machines

We have been manufacturing them for the past thirteen years, and the experience gained in all those years is at your disposal. We make these machines in three sizes, as follows, using

26-in. saws for 8-in. cants, as illustrated.

32-in. saws for 10-in. cants.

36-in. saws for 12-in. cants.

Each size is of the very latest design and up-to-date in every improvement.

May we send you a list of satisfied users

We also make a complete line of twin circulars with chain or steam feed for slabbing logs for these machines.

Saw Mill Machinery FOR SALE

The following machinery is in good condition and is the balance of the Wm. Peter Estate Saw Mill at Parry Sound.
Write for quotations on any or all of this equipment.

- 1 Wicks Oscillating Gang Saw, 20-inch stroke, 37 saws wide, made by Wm. Hamilton Co., Peterboro, complete with live rolls, front and rear, spare set of Brasses for both ends of Pitman rod, 1 spare oscillating side, and 1 spare slide.
 - 1 right hand Allis Band Mill, single cut, 9 ft. wheels, Waterous Co.
 - 1 left hand single cut Allis Band, 9 ft. wheels, Waterous Co.
 - 1 right hand 3-Block Carriage, 40 inch, fitted with Payette set works, friction receder, 5 trucks, frame of carriage oak; never been used, except set works, which have been refitted; carriage built by E. Long Mfg. Co., Orillia.
 - 1 Steam Feed, 10 inch dia., 36 ft. long, vertical valves; never been used since being installed.
 - 2 Pneumatic Air Bumpers, 16 x 24; never been used.
 - Track and Flat (new).
 - 1 Steam Nigger, Waterous Co.
 - 1 Steam Loader, Waterous Co.
 - 1 Steam Kicker, with shaft and arms.
 - 1 right hand Champion Edger (Waterous Co.), 48 inches, 3 stationary saws, 2 movable saws.
 - 1 left hand Hamilton Edger, 54 inch, 4 stationary saws, 1 movable saw.
 - 1 Engine, 14 x 20 slide valve, Payette fly-wheel, 5 ft. diameter, 30 in. face.
 - 1 Engine, 11 x 18, slide valve, Inglis & Hunter fly-wheel, 6 ft. diameter, 16 in. face.
 - 1 Patterson & Berryman Water Heater.
 - Gordon Hollow Blast Grates, installed under 6 boilers, with blower located in mill; blue prints and instructions on hand.
 - 1 Geared Friction Log Haul, and chain about 300 feet.
 - 1 Ewart's Detachable Chain.
 - Special Heavy Forged Chain, about 800 feet.
- We have also on hand Live Rolls Drives, Pulley, Gears, Shafting, in addition to Filing Equipment, etc.

GRATON AND KNIGHT

Conserve Power

Today every item must be carefully considered which will increase the production of food, equipment, and ammunition. With this greater demand for production and the consequent heavier load on power equipment, the superiority of Graton & Knight Belts becomes more emphatic.

Whether you measure by length of service or maintained efficiency, Graton & Knight Standardized Leather Belts reduce your horse-power cost per year, increase production, and reduce machine interruptions.

Transmission of power is a more important item today than ever before and now is the time for you to get at the real facts concerning it.

Write for information on Standardization as applied to Leather Belting.

GRATON & KNIGHT

Standardized Series
LEATHER BELTING

Invited by us for testing use

One of the most difficult and costly operations in sawmaking is the grinding of blades to taper. Disston Cross-cut Saws are ground uniform in thickness along the entire tooth-edge, gradually tapering thinner to the back. This prevents kerf binding. There is no sacrifice of weight, stiffness or elasticity by the Disston Method of Grinding.

This is one of the reasons why Disston Saws run easiest, cut fastest and last longest.

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention !

We have the **ONLY** device that removes **ALL** danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, break-downs or dislocation of parts—**IT WORKS ALWAYS**. Though still new, it is thoroughly tried and tested, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you **TEN** times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you **CAN** use them with this equipment; you need it on your cars right now, and you will **WANT** it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

Dunlop "Gibraltar RedSpecial" Belting

Abnormal Friction Pull

vs. Elasticity of Friction

BETWEEN every ply of specially-selected, heavy Cotton Duck in Dunlop "Gibraltar RedSpecial" Belting is a layer of pure Rubber which, through a Dunlop calendering process, so permeates the fabric that it binds the several plies into one integral piece.

Some belt manufacturers offer to sell their product on the basis of "Heavy-Poundage in a Friction-Pull" Test. To obtain the latter result it is not necessary to secure such an expensive Rubber Friction as is used in "Gibraltar RedSpecial." This fact alone ought to be a pretty good gauge of the value of the "friction-pull" test.

In buying "Gibraltar RedSpecial" you get the advantage of years of careful laboratory work on our part with this result: The friction is of that "just-right" elastic quality which allows for the give and take necessary in rounding the pulleys; hence the reason "Gibraltar RedSpecial" is known for maximum Power, Speed and Service.

Note the Short Grain Rubber Friction

This Belt Section illustrates a Heavy "Poundage-Pull" Friction. To secure this result the Friction Grain is short and stiff. Elasticity and Flexibility have been sacrificed to secure such a result.

Note the Long Grain Rubber Friction

Dunlop "GIBALTAR REDSPECIAL" has a Friction of Special Dunlop Rubber that retains its life indefinitely. "Note the long grain Rubber Friction," as illustrated. Elasticity has not been sacrificed for Abnormal Friction Pull.

UNLIMITED capacity for service is an intrinsic quality with Dunlop "Gibraltar RedSpecial" Belting. The success of nearly a quarter of a century in the manufacture of Rubber Products is built into Gibraltar. The original Made-in-Canada Red Rubber, Frictioned Surface Belting, "Gibraltar RedSpecial" has stood the infallible test of time in turning the wheels of industry in a multitude of Canadian plants from the Atlantic to the Pacific.

The Dunlop Unreserved Guarantee

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where the "Gibraltar" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

Logging the Year Round

By the means of modern Logging Machinery for skidding the Logs from the stump to the track Logging operations may proceed the year round, regardless of ground conditions. Logs may be skidded across bogs, swamps, ravines, etc.; may be brought up out of bad depressions or "pockets"; may be carried over small streams; up or down hill, over or around obstructions or obstacles of any kind. And all this may be done without the expense of building roads, and without the delay of waiting for the ground to dry up or freeze up so you can get on it.

Lumber is needed, and urgently needed, in many ways for the prosecution of the war. Therefore, lose not the precious summer months, but cut and ship every working day in the year.

We make the machinery to enable you to Log the Year Round. Our Booklet, "Suggestions for the Lumberman," tells how this machinery is used.

LET US HEAR FROM YOU IF INTERESTED.

Marsh Engineering Works, Limited

Belleville, Ontario

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

The C C 25 Drift Bolt Driver in the Shipyard

¶ The Drift Bolt Driver shown in the cut will drive home in 25 seconds a drift bolt five feet long, 1 3/8" diameter, with 1/16" drift.

¶ For down driving the same tool is used with the air feed removed and replaced by a cross handle. For either upward or downward drive two men with the C C 25 Drift Bolt Driver will accomplish as much as three men working by hand.

¶ The tool is sturdy,—steel throughout, has automatic lubrication, single throttle control, and the air feed for upward drive is simple and powerful.

In one advertisement we cannot tell you of all our labor-saving devices for the shipyard—the "Imperial" motor-hoists that simplify hoisting problems, the "Little David" wood-borers, portable saws, etc., but our nearest office will be glad to advise you. Write for some of our bulletins, say 8006 and 8507.

This is a snap shot of the Adams Pointer

"Game for Anything"

Adams Pointers

Adams Pointers will tackle the heaviest work and surprise you with their powers.

These sturdy little crafts with their well built easy running engines are in use all over the Dominion.

Our catalogue and blue prints will explain the various advantages which Adams Pointers have over alligators and tugs. Lumbermen are quick to see that it is cheaper to work with an Adams Pointer.

Adams Engine Co., Penetang, Ont.

J. T. PAYETTE, Proprietor

MAKING GOOD LATHS

At a Rapid Rate

The
Payette No. 1 Bolter

will beat anything yet produced. A recent ten hour test showed 128,350 as the number of laths cut, counted, tied and piled. These were 4 foot laths 1½ by ¾ inches.

Four hundred saw mills in Canada are at present using Payette Lath Machinery. Enough said!

*Always pleased to answer

The CORBET
Automatic Steam Towing Machines

The Corbet Automatic Steam Towing Machines are installed on a large number of the best Tugs on the Atlantic and Pacific Coasts and on the Great Lakes and have proved so satisfactory that not one of our customers would be without them under any circumstances as they have proved the best investment the owner ever made in equipping his tug. Why continue to be without our Towing Machine which will increase the efficiency and earning power of your tug?

Write for information, testimonials and prices.

The Corbet Foundry & Machine Co., Limited
OWEN SOUND, ONTARIO, CANADA

—an important factor

—to the millowner who wishes to increase dividends and reduce overhead charges to a minimum is the successful manufacture of by-products from what would otherwise be waste. The "waste" of a lumber mill can be made the basis of a most profitable industry in the production of chemicals, wood-pulp, etc.—products which are in great demand and at big prices. We have specialized in the installation of chemical plants in all parts of the world for over 75 years, and our knowledge and experience is yours on request.

Let Us Hear From You

DISTILLATION PLANTS: Slabs, Limbs, etc.

ALCOHOL PLANTS: Sawdust, Shavings, etc.

PULP MILL EQUIPMENT: Soda, etc.

OXALIC ACID PLANTS: Sawdust, etc.

**WASTE SULPHITE LIQUOR

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.

Pulpwood, 246,282 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Always
"On Hand":

**150,000 Sq. Miles
of Good Timberland**

*Of course neither
James D. Lacey & Com-
pany nor anyone else can afford
to own and hold any such area—
we wish merely to express roughly
the completeness of our facilities.
We either own, hold option on
or "know about" the best pur-
chases of whatever size, kind and location
you may want in that best of sure profit
investments—sure profit, that is, if you
buy right and get what you pay for.*

*As by far the largest
timberland factors in the world,
James D. Lacey & Company are nearly
certain to be in touch with any worthy
possibilities, and their 38 years' experience
of success plus their large resources is
assurance of satisfaction and equity to
all parties.*

*The Babbitt Metal that's at the Front in Efficiency
and Economy*

HARRIS HEAVY PRESSURE

THE ARISTOCRAT OF BABBITT METALS**SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well. So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours
JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS****THE CANADA METAL COMPANY, Limited**Head Office and Factory **TORONTO** Fraser Avenue

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"

FIRE BRICK

Each brand is specially suited to a separate use. We have the experience to manufacture and supply the finest grade of Fire Brick for the varying uses of the Lumber Industry. The same brick may not meet the requirements of your Dutch Oven and of your Refuse Burner.

This is a product that should have your most careful attention. When so much depends directly on the successful operation and dependability of Fire Brick in your plant, it will repay you many times to make a most careful investigation before the installation. Let us show you where our product has been successfully used for years. Let us suggest a special brand for your particular purpose.

We have an interesting catalogue that will be sent you. It will give you an insight into the proper methods of Fire Brick construction.

ATKINS

ALWAYS AHEAD!

The most advanced improvements in Saw manufacture have placed us far ahead in the manufacture of Saws for all uses.

Our Band and Circular Saws are worthy examples. They cut more timber—do it with less power and require less repair to be kept in perfect condition.

Economy in mill operation has proved their value. Put them through competitive tests with other Saws.

The Sterling quality of

Atkins Sterling Steel Saws

will overcome your difficulties.

Lath Machine and Bolter

This machine is a combination of our No. 2 Bolter and No. 2 Lath Machine mounted in a single frame. The lath machine is made the opposite hand to our single machine. The illustration shows the lath machine side of the combination. In mills where the floor space is limited and the output must be large this machine is an ideal combination. The details of construction found in our No. 2 Lath Mill and No. 2 Bolter apply to the combined machine.

When you overhaul your mill get in touch with us about new equipment

**We have the following on hand
ready for shipment**

one Portable Saw Mill outfit with Right hand Saw Frame and Carriage—set of track timbers, also the following items:

No. 1 Log Jack with foot wheel and idlers.

No. 7 Log Jack with foot wheel and idlers.

10 inch by 36 ft. Steam Feed.

10 inch by 42 ft. Steam Feed—Either feed can be furnished with vertical or horizontal valves.

Double acting set works in No. 1, 2 and 3 sizes.

We have one second hand plain slide valve engine, right hand, side crank, 9 x 15, suitable for a small saw mill plant.

Write at once for information regarding the above or any other machinery you may need

EDGERS

Waterous New Champion Edgers

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. No other edger has this feature.

Waterous

BRANTFORD, ONTARIO, CANADA

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 70c per lb.; West of Fort William, 75c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

\$5,000,000.00

**worth of mixed metal
sold annually.**

Midland, Ont., August 16th, 1917.
The Corbet Foundry and Machine Co., Limited,
Owen Sound, Ont.

Dear Sirs,—

We are pleased to be able to report to you that your No. 2 Automatic Steam Towing Machine, which has 1200 ft. of 1-inch dia. Steel Hawser, which you installed on our tug D.S. Pratt, is giving us first-class satisfaction. We have been using this machine two years and there is no doubt but that it is far ahead of the old manilla rope, both in cost and trouble of handling. We take pleasure in recommending same.

Yours truly,
Canadian Dredging Co., Limited,
Norman L. Playfair, Sec.-Treas.

Saw Mill Machinery FOR SALE

The following machinery is in good condition and is the balance of the Wm. Peter Estate Saw Mill at Parry Sound.
Write for quotations on any or all of this equipment.

- 1 Wicks Oscillating Gang Saw, 20-inch stroke, 37 saws wide, made by Wm. Hamilton Co., Peterboro, complete with live rolls, front and rear, spare set of Brasses for both ends of Pitman rod, 1 spare oscillating side, and 1 spare slide.
- 1 right hand Allis Band Mill, single cut, 9 ft. wheels, Waterous Co.
- 1 left hand single cut Allis Band, 9 ft. wheels, Waterous Co.
- 1 right hand 3-Block Carriage, 40 inch, fitted with Payette set works, friction receder, 5 trucks, frame of carriage oak; never been used, except set works, which have been refitted; carriage built by E. Long Mfg. Co., Orillia.
- 1 Steam Feed, 10 inch dia., 36 ft. long, vertical valves; never been used since being installed.
- 2 Pneumatic Air Bumpers, 16 x 24; never been used.
- Track and Flat (new).
- 1 Steam Nigger, Waterous Co.
- 1 Steam Loader, Waterous Co.
- 1 Steam Kicker, with shaft and arms.
- 1 right hand Champion Edger (Waterous Co.), 48 inches, 3 stationary saws, 2 movable saws.
- 1 left hand Hamilton Edger, 54 inch, 4 stationary saws, 1 movable saw.
- 1 Engine, 14 x 20 slide valve, Payette fly-wheel, 5 ft. diameter, 30 in. face.
- 1 Engine, 11 x 18, slide valve, Inglis & Hunter fly-wheel, 6 ft. diameter, 16 in. face.
- 1 Patterson & Berryman Water Heater.
- Gordon Hollow Blast Grates, installed under 6 boilers, with blower located in mill; blue prints and instructions on hand.
- 1 Geared Friction Log Haul, and chain about 300 feet.
- 1 Ewart's Detachable Chain.
- Special Heavy Forged Chain, about 800 feet.
- We have also on hand Live Rolls Drives, Pulley, Gears, Shafting, in addition to Filing Equipment, etc.

JOHNSON'S Veterinary Remedies

are the surest, the most economical and the best medicines with which to equip your stables. They have been on the market for twenty-five years and still retain their superiority over all others.

The quality never varies, it is our first consideration.
Prices taking effect July 1st are as follows:

Johnson's Horse Liniment No. 1	Per Gal.	\$7.00
Johnson's Horse Liniment No. 1	Quarts, Per Doz.	19.00
Johnson's Horse Liniment No. 1	Pints, Per Doz.	10.00
Johnson's Horse Colic Remedy	Per Gal.	10.00
Johnson's Horse Colic Remedy	Quarts (8 Doses each) Doz.	23.00
Johnson's Horse Colic Remedy	Pints (4 Doses each) Doz.	12.00
Johnson's Veterinary Healing Ointment (Gall Cure)		
2 lb Tins	each 2.25 Doz.	24.00
1/4 lb. Tins	Per Doz.	4.00
Johnson's Concentrated Condition Powders, 1 lb. Pkgs.	Doz.	4.80
Johnson's Horse Worm Powders,	Pkgs., Per Doz.	2.50
Johnson's Purging Balls	Per Doz.	2.50
Johnson's Antisepting Dusting Powder		
(For Drying and Healing Sores, Proud Flesh, etc.)	Per Doz.	8.00

Our Family and Van Remedies are as follows:—

Pine and Tar Cough Syrup	Big 4 Liniment—Mosquito Oil
Purgative Pills	X Ray Liniment
Little Liver Pills	Cholerine Mixture (Diarrhoea)
Porous Plasters	Headache Powders
Stomach Bitters	Sarsaparilla
Laxative Cold Tablets	All Healing White Ointment

All Drugs and Patent Medicines at Market Prices.

Better Draft

and therefore greater efficiency can be obtained from your boiler fires (even when burning wet waste material) by the use of a high grade efficient blower such as this Turbo Blower called the "**Coppus**." It is made to suit all sizes of boilers and will give any steam pressure required. It is simple and practical. When we say that it will double the powers of a boiler furnace which burns moist refuse—we are stating an absolute fact.

Take advantage of our wide experience in this work. We undertake to solve your draft problems quickly and cheaply.

Give us the data we ask and let us supply the size of blower best suited to your boiler capacity. Meanwhile—

Kendall Gang Circular

The Machine that will convert your small logs into more and better lumber, quicker than ever before.

The illustration shows one of the latest designs of gang circular patented by Mr. I. N. Kendall, the well-known millwright, of Ottawa. This machine takes 16-26 in. diam., 10 gauge saws—will cut cants up to 8 inches in thickness, and we furnish with it necessary saw collars for any thickness of lumber desired. It has a hollow mandrel, water cooled saws; each saw has a separate guide; easily accessible and readily adjustable, and the bridge tree is so designed that it can be removed, the saws taken off and a new set put on in 7 to 10 minutes. Safety fingers hung just inside the front press roll prevent a cant flying back off the saws. Lumber cut on these machines is guaranteed to come out absolutely true to size from end to end, and so smooth that 1/16 in. over size is all the allowance necessary for finish.

Read what one user says about it:—

"The machine has given every satisfaction and in many cases far exceeded my idea of sawing lumber; the proof of this being that our customers are paying me \$1.00 to \$1.50 per thousand more for certain classes of lumber than they can purchase same quality elsewhere—this advantage being purely on account of the uniform and smooth sawing this saw is capable of doing."

We are the original manufacturers of these machines

We have been manufacturing them for the past thirteen years, and the experience gained in all those years is at your disposal. We make these machines in three sizes, as follows, using

26-in. saws for 8-in. cants, as illustrated.

32-in. saws for 10-in. cants.

36-in. saws for 12-in. cants.

Each size is of the very latest design and up-to-date in every improvement.

May we send you a list of satisfied users

We also make a complete line of twin circulars with chain or steam feed for slabbing logs for these machines.

No. 9

Public Service Organized on Entirely New Basis

The bare announcement that 1,200 men have gone to various parts of the province of Ontario to serve as fire rangers under the direction of the Department of Lands, Forests and Mines for the coming season is more interesting than usual. Some new features connected with the appointments this year are that they have been made on the ground of merit, efficiency and worth, rather than through the former method of political pull, or as it is more commonly termed, "log rolling." Heretofore the qualifications of a fire ranger have been in too many instances his ability to manipulate matters so that he could land what was usually regarded as a prolonged season's outing. For a decade or more small consideration was given to the important character of the work, its responsible nature and the unceasing vigilance required in the faithful performance of such duties. Little need be said, however, on this side of the subject, as a fire ranger's work to-day is more important and vital than at any previous period. The qualifications of the men must be such that they are in every way fitted for the positions, since appointments are no longer made through nepotism or patronage.

Another feature that arouses considerable favor is the appointment of returned soldiers who are able to follow outdoor employment. Last year a number of veterans suffering from shell shock were taken from the institutions where they were being treated and placed on the staff. The open air life, elevating surroundings and sense of freedom and quietude engendered by the forests seemed to have lifted the thoughts of the men off any physical disability and resulted in exhilaration and convalescence. Nerves have been strengthened, weak constitutions built up, and ambition and hope restored in the dispirited, and the depressed. No man can mingle amid the tall timbers for many months without experiencing new feelings and realizing that after all environs have much to do with the mental and physical well-being of every individual. That the Department of Lands, Forests and Mines has given heed to the claims of so many returned soldiers

and that about 300 have been appointed as fire rangers, is an act worthy of consideration. This is one of the callings which the men can follow with the greatest benefit and improvement, if they are physically able to move about and give some study to the requirements of the work.

It is interesting to learn that no men who have been exempted from military service or boys under military age are being employed this year. The Department has very wisely assumed that if men of these ages are fit to do fire ranging they are able to do their bit in the great productive campaign and will be more useful on the farm as soldiers of the soil. Most of those who have been engaged are married or over military age, and they range in years from 33 to 55.

The work of safeguarding the wooded wealth of Ontario is no longer a prolonged furlough, camping expedition, or pleasant diversion for university students or men fitted for military service or farm work.

Proposed Regulations for Feeding of Men in Lumber Camps

The conservation and regulation of the food supplies of the Dominion is claiming attention from every branch of industrial activity. Suggestions covering the meal service in camps have been sent out by the Food Control Department at Ottawa, to the various companies carrying on woods operations and the lumbermen in different sections of the Dominion have held important meetings to consider the fixed allowances per man per diem. These proposals have met with hearty response on the part of the industry and every member has expressed willingness and readiness to co-operate with the authorities to the fullest extent.

For some years there has been considerable rivalry among concerns carrying on work in the woods with respect to which could set the best table, offer the largest variety and present the greatest number of delicacies and in the most generous quantities. On all sides it is admitted there has been too lavish an expenditure for menus which has led to extravagance and waste. The whole system of feeding the lumberjack is about to be reformed and placed on a sound, economic and uniform basis—standardized nationally. At one of the meetings a prominent member stated that lumbermen in providing food at the shanties had shown more rivalry than New York hotels. Even with the rich and appetizing bills of fare which have been furnished in many camps, men have complained of the character of the viands and travelled on to the next scene of operations in large numbers.

Instead of half a dozen kinds of pie, cake and pudding, the lumberjack during the coming season will probably have to content himself with one variety and if dissatisfied he can gain nothing by jumping his job and journeying on to the next camp. There the regulations will be the same and he will get meat, wheat products, butter, sugar, fats, etc., in just the same quantity and surrounded by the same restrictions. It will be a case of Hobson's choice—that or none. The cooks of the camps will be placed under a strict regime, with heavy penalties attached, for violation of any of the food laws, while all the lumber companies will be licensed and compelled to present periodical sworn reports regarding the number of meals served and the quantity of foodstuffs consumed. All camps will be visited by inspectors to see that the federal mandates are carried out.

Another request made by the lumber companies is that the rules of the Department regarding the quantities of meat, wheat and other edibles to be consumed shall be printed and prominently posted in every camp so that the law may be ever in front of the men. They will thus have a healthier respect for what the Ottawa authorities are endeavoring to effect in conjunction with logging operations. No real hardship will be imposed on any employee, but the truth must be driven home in every conceivable way that it is necessary to conserve the supplies to feed the men at the front; that waste is a crime, gluttony treason, and sane rationing the supreme need of the hour. Why? In order to protect and safeguard the armies and starving people of Europe.

Pigs will be kept near every camp, and all table and kitchen refuse fed to them, thus eliminating any waste which can be used to the greatest advantage. The raising of pork is one plan to which the heartiest endorsement has been given. Concerted effort will be made

to co-operate to the full extent with the Food Controller in seeing that, from a patriotic and productive standpoint, the complex problem is dealt with in a firm, fearless manner. Licensing of camps by the Food Board, rationing of the men, collective, coordinated control by the companies which spells efficiency and obviates waste and error, will become effective in the production and distribution of supplies, and in helping along the winning of the war.

How Far is Contract to be Honored These Days?

When is a contract binding? Are there any differences in agreements of a written character as applied to manufacturers, wholesalers or retail lumbermen? Recently several representative lumbermen were assembled, and the subject under discussion was "contracts." One of them remarked that retailers of late had not sought to evade or cancel any agreements and he presumed the reason was the scarcity of stock in certain lines, delayed deliveries and constantly ascending prices. Market conditions, he added, have been such that the retail lumbermen who in the past endeavored to side-step contracts and cross lots in reference to certain agreements have been very anxious to live up to everything in the way of a covenant during the past few months. It was not so, another speaker said, in ante-bellum days, when values were receding and many retailers essayed to avoid implementing their obligations. Why? because in many instances they found that prices were lower, and they possibly could place trade elsewhere to better advantage than with the wholesalers or manufacturers with whom they had ordered so many car loads earlier in the season.

All this brings up the question of the sacredness and honor of a contract. How far is it binding on wholesaler and retailer? Is there any difference whatever in the application of the letter and spirit that should be lived up to? Nowadays with the stringent terms which wholesalers are held to, even to the advancing of 90 per cent. to mills on that stock is cut each month, whether the output is sold or not—wholesalers contend that should there be a slump in the situation—which, of course, is not expected until the war is over—that now is the time to consider the observance of contracts.

"It is a peculiar condition," remarked one wholesaler recently, "that no retailer ever wants to cancel when values are ascending, but let a certain grade or line of lumber decline and various excuses are put forth for not carrying out the understanding. Some customers come forward frankly and conscientiously say that they do not purpose living up to the agreement for the simple reason that they can buy cheaper elsewhere."

The openness of such a statement is, at least, appreciated, but others endeavor to side-step the issue by complaining of being overstocked, market being dull, lumber not up to grade, service faulty, deliveries unsatisfactory, cancellation of contracts by customers, and various other pretexts. Once in a while a customer will carry out a contract even when he knows that he can purchase cheaper elsewhere.

"There is this to be said," observed another speaker, "that when we find a man living faithfully and conscientiously up to every agreement, we are going to do our best to protect him in times of depression or when anything attractive is offering. Frequently we are in a position to tip him off regarding some snaps, special buying concessions or probable advances, in return for his keeping his word with us. It is a peculiar situation which makes it binding and obligatory in every way for a wholesaler to adhere strictly to the terms of his contracts with any mills, no matter what may result or what emergency arise, and frequently allows a retailer to play fast and loose with such affairs."

"The wholesale lumberman must stick to his compact, and assume responsibilities that are much larger and more burdensome than they were a few years ago when conditions of payment and financing were far easier. I throw out this suggestion in the hope that some retailers who are in the habit of cancelling, perchance on very weak grounds, may see the necessity and advisability of living up to their word. To side-step owing to prices fluctuating is neither fair nor reasonable. It is a poor rule that won't work both ways, and

if a wholesaler protects a retailer on a rising market, is there any valid reason why a reputable and responsible yard man should, in case values decline, seek to elude his share of the loss?"

In the game of business life the man who does the right thing at the right time seldom suffers. One who faithfully and loyally carries out his contracts, even though at a reverse, will be the gainer in the long run, not only in the matter of earning the goodwill and kindly consideration of those higher up in the trade, but in numerous other ways in which, when conditions are altered, they are able to make retribution on grounds more enduring than a mere dollars and cents basis.

Great Work of Canadian Timbermen in Overseas Service

When the history of the greatest world war comes to be written and the specific performance of the various units contributing so valiantly in the fight for freedom are carefully weighed, there will be a generous appreciation of the part that is being silently but effectively played by the sturdy Canadians in the forestry and lumbering corps.

These men, drawn from all ranks of the timber industry, have gone about their tasks with a cohesion, hustle and animation, that only those who have observed their wonderful achievements at close range, can adequately value. In a recent issue of the "Canada Lumberman" something of their self-denial, enterprise and push was related by Major J. I. Hartt, M.P.P., of Orillia, Ont., a well-known Canadian lumberman. Captain W. E. Schuster, of Belleville, Ont., who after two years' service overseas has returned home, during which time he filled many important positions, also speaks in glowing terms of the activity and esprit de corps of the Canadians, both skilled and unskilled, who have carried out such extensive timber operations in Great Britain and the allied countries.

For untiring efforts and devotion to the cause, the Canadian Forestry Corps, which is the comprehensive military term employed to cover all workers in tree felling and sawmill operations, is worthy of the highest praise. For real organizing and executive ability the eyes of the countries in the old world have been opened by the resourceful and adept Canadians, who have on every occasion accomplished more than they have been called upon to do.

At the beginning of the present year there were thirty-two companies in operation in Great Britain, and nearly double that number in France, the strength being approximately twenty thousand men, nearly all being native Canadians. The appeal from the Mother Country for men to undertake the important work of cutting timber were promptly and admirably answered, and while actual figures of production cannot be given, were the many millions of feet of timber revealed the total would appear almost incredible. What men united and properly officered, stimulated by high purpose and firm resolve, can do is amply demonstrated in the achievements of the forestry corps in backing up the gallant stand of the troops on the firing line. Perhaps, some one may observe with a sneer, that the work undertaken has been of a "safe" character and should, therefore, not be placed in the same niche as that of combatants.

For the information of any doubting ones it may be pointed out that these men have been subject to the greatest danger, privation and hardship. While some companies are far removed from the actual fighting zone, there are many others which have carried on their night and day operations under the shadow of the heavy guns, being frequently shelled and attacked from the air by the flying birds of prey.

When one thinks of the amount of timber required for laying steel, erecting huts, supporting trenches, improvising dugouts and building plank roads to bring up "the heavies" through the deep mud and over almost impossible physical barriers, too much praise cannot be bestowed upon the Canadian Forestry Corps for the abundant supplies delivered. The men are doing their bit in detailed work for the various positions held by the troops. When it is considered how much preparation is elementally dependent upon adequate supplies of lumber and timber, one can gauge something of the endeavors of the Canadians in cutting down trees, erecting and equipping sawmills and turning out millions of feet of the products of the forest for the safety, progress and comfort of our fighting forces.

Discrimination Against Canadian Shippers!

Wholesale Lumber Dealers Call Upon Railway Commission to Suspend the Export Lumber Tariff—Protests to be Sent to Many Organizations

The monthly meeting of the Wholesale Lumber Dealers' Association, Inc., was held on April 19th, at the Queen's Hotel, Toronto. There was a large attendance and much important business was attended to. Mr. A. E. Clark occupied the chair. A proposal for the extension of the Association, to take in members from Montreal and Ottawa, and to affiliate the work of the Association with that of the Canadian Lumbermen's Association, came up for discussion in connection with correspondence regarding the matter which had passed between the secretaries of the two Associations. After considerable discussion it was decided to leave this matter in the hands of the executive.

Fire Insurance Increased Rates

A report upon the increased fire insurance rates recently announced by the Canadian Fire Insurance Underwriters was presented to the meeting in a letter from Mr. W. C. Laidlaw, Chairman of the Insurance Committee. In his letter Mr. Laidlaw said:

"The increase is a general one and applies to a number of industries as well as that of woodworking. The increase, as it affects the lumber business, is one of 50 cents to the base rate for occupancy. There is also a general increase applying to all businesses for overtime and night work—20 per cent. extra for permission to work up to 10 p.m., 30 per cent. extra to work up to midnight, and 50 per cent. to work all night.

"These increases have been adopted by the Canadian Fire Underwriters' Association which controls all board companies. It is reported that the non-tariff companies are following their lead and doing the same thing. The fire insurance companies claim that there have been unusual fire losses recently and that they are compelled to increase their rates in order to cover their extra losses.

Neither of the increases above apply to sawmills, but they affect all other woodworking plants."

Mr. Laidlaw's report then went into an analysis of the proposed changes.

The first provision of the changes is one which cancels all tariff rates on a number of industries, including all woodworking risks (except sawmills), and pulp and paper mills.

The occupancy charge on all woodworking risks, including painting or finishing shops is increased by 50c (from \$2.50 to \$3.00).

In addition to the increases in occupancy charges, the key rates of a number of cities in Ontario have been increased. From April 15th no policies are being issued on manufacturing risks coming within the classes mentioned except at the new rates. It was provided also that if current policies were cancelled before the 15th of April, short dates were to be charged, even though the insurance was to be replaced for twelve months.

With the exception of industries in which overtime work is essential all manufacturing plants will be charged an additional rate for the privilege of working overtime, as explained in Mr. Laidlaw's letter above. Sawmills, and pulp and paper mills are exempt from overtime extras, and other risks in which it is absolutely necessary to work at night may be exempted.

After considerable discussion, in which it was made evident that the members desired to do all they could to be of assistance to the planing mill men in this matter it was carried that the matter should be referred back to the Insurance Committee for a further report as to the actual effect of the changes, so far as the planing mills are concerned.

Advance in Workmen's Compensation Rates

A communication from the Long Lumber Company, of Hamilton, regarding the increased rates for workmen's compensation, was read by the secretary. The rate for planing mills for 1918 has been increased by the Board from \$1.80 to \$2.00 and Mr. Guy H. Long, discussing the matter, stated that the rate was excessive in comparison with other rates. For instance, the rolling mills in Hamilton, which had a far greater average number of accidents were only to be charged the same rate as the planing mills. He thought that the retail lumbermen were being "soaked" because they had not taken the matter up with the Board. The furniture factories and a number of other manufacturers had taken their cases up with the Board and had got better rates. He believed it would be a good move if they could work out the whole thing and then have a meeting with the Board. They were only interested indirectly through the retailers, but he believed that it would be advisable to help the retailers in this way.

This matter was discussed by the members and it was decided that it would be best to have the retailers take it up before the wholesalers deal with it.

The Stop-off Service—Membership Grows

A letter from Mr. Marshall, Traffic Manager of the Board of Trade, dealing with the proceedings which had taken place in connection with the proposal of the railroad companies to cancel and restrict a number of the stop-off services and to increase the charge for others, was read by the secretary. A motion was carried approving of the course already adopted by the transportation committee in this matter and commending the stand taken by them and by other lumbermen at a meeting on April 10th, in the offices of the Canadian Manufacturers' Association, Toronto, when the representatives of the railroad companies were shown what a disastrous effect their proposed changes would have upon the lumber manufacturing and dressing-in-transit plants.

A motion of condolence was carried in connection with the death of Lieut. John A. Gordon, son of Mr. Alex. C. Gordon, of Mickle, Dymont and Son, Toronto. Lieut. Gordon was killed in action in France, on April 4th.

The membership committee reported that three new members had joined the Association since last meeting, viz., A. N. Dudley, Toronto; the R. Laidlaw Lumber Company, Sarnia, and Mickle, Dymont and Son, Barrie.

The Chairman reported that the Southwestern Ontario Retail Lumber Dealers' Association at their annual meeting in Sarnia on April 16th, had expressed a desire to be favored with a list of the members of the Wholesale Lumber Dealers' Association, Inc., and on his suggestion the secretary was instructed to furnish the secretary of the Southwestern retailers with a list.

Protest Against Increased Export Freight Charges

A long discussion took place regarding a communication made by the chairman, to the effect that the Canadian railway companies had decided to charge the full fifteen per cent. increase permitted by the Board of Railway Commissioners, not only on domestic business as provided for in the Board's order, but also on through traffic from Canadian points to points in the United States.

Mr. Clark pointed out that according to the order of the Interstate Commerce Commission which gave United States railways permission to increase their rates by fifteen per cent., the increase on lumber rates is not to exceed 1c per hundred pounds, and that therefore the fifteen per cent. increase charged by the Canadian railroads on the United States portion of a through haul would, in a great many cases, be a discrimination against the Canadian shippers. Mr. Clarke also reported that the new tariff filed with the Dominion Railway Board covering this charge was to go into effect on April 10th, which left the Canadian shippers no time for protesting against it, as they had not received notice of it until the 19th, and even this notice had been obtained in a round-about and informal manner. On the United States portion of the haul this increase will amount, in some cases, to as much as 4½c per hundred pounds, which will be a serious handicap as compared with a maximum increase of 1c per hundred pounds permitted by the Interstate Commerce Commission of the United States.

Mr. Clark reported that as Chairman of the Wholesale Lumber Dealers' Association he had taken the liberty of wiring the Chairman of the Board of Railway Commissioners protesting against the export lumber tariff dealing with this matter which had been filed by the Canadian railway companies, and asking for its suspension pending a hearing on the subject. At his request several other members of the Association had also wired to the Board.

After the members had discussed the matter and expressed indignation at the treatment given to the lumber shippers, a strongly worded protest was drawn up by a special committee consisting of Messrs. G. H. Long, W. J. Lovering, and A. E. Eckardt. The motion protested against the new tariff, asked the Board on what authority they granted it and called for the suspension of the tariff.

A motion was carried that this resolution should be sent to the Board of Railway Commissioners in a night letter. The secretary put the resolution on the wire and received on Monday morning following, April 22nd, the following letter from the secretary of the Board:

"The request for the suspension of the export lumber tariff was

not received until to-day (April 20th), when the tariff was already effective, and, consequently, the Board is unable to suspend. If exception is taken to the tariff in question, which is now effective, the parties should submit written statements showing in what regard exception is taken thereto, and why."

Mr. W. N. Gillespie, of North Tonawanda, N.Y., who was a guest at the meeting, spoke briefly regarding trade conditions in the United States. He expressed the opinion that the Interstate Commerce Commission would have something to say about the export lumber tariff of the Canadian railroads, so far as it affected charges for freight hauls in the United States, and he undertook to notify the lumber associations at North Tonawanda and Buffalo and see what they could do about it.

The secretary was also instructed to send copies of the protest of the association to the Canadian Lumbermen's Association, the Canadian Manufacturers' Association, the Toronto Board of Trade, and the National Wholesale Lumber Dealers' Association of the United States.

Mr. H. J. Terry reported that Mr. John Donogh, wholesale lumber dealer, Toronto, was very ill, and suggested that the members should send him a bouquet of flowers and a letter expressing their regret and their hope that he would soon be restored to health. The suggestion was put in the form of a motion, seconded by Mr. J. P. Johnson, and was unanimously carried.

Trade Acceptances and Note Renewals

The Chairman then made a report upon the proceedings of the annual meeting of the National Wholesale Lumber Dealers' Association, recently held at New York, dealing chiefly with the steps that had been taken to introduce the use of trade acceptances in the lumber trade. He commended the use of these forms of acknowledgement on an account due, and expressed the hope that something similar might be adopted in Canada.

A motion presented by Hugh A. Rose, and seconded by G. H. Long, was carried, that the secretary should make application to the Board of Railway Commissioners for Canada to have copies of all traffic affecting lumber sent to the Association as soon as they have been filed with the Board.

Mr. Long advised the members that recently fifteen cars had been placed on his siding at Hamilton in one day. Some of these cars had been on order for a long time, and others had been ordered more recently. He had represented to Mr. Letch, of the Car Service Bureau, Traders Bank Building, Toronto, that while this was not what was properly known as "bunching," it was quite impossible to unload cars in time to avoid a heavy charge for demurrage, and the Bureau had recognized the justice of his position and made a substantial allowance as compared with the charge which he would otherwise have been obliged to pay. Mr. Long stated that he reported this in order to advise other dealers, retailers in particular, that they could secure consideration of this nature whenever they met with similar conditions.

Mr. Leslie Clark, of Edward Clark and Sons, Limited, Toronto, who had been in poor health for several weeks past, entered the meeting in company with his father, Mr. Edward Clark, towards the close

of the evening, and was given a warm welcome by the members, who congratulated him on his return to health. Mr. Clark expressed his appreciation of the welcome, and had pleasure at being able to join the members of the trade once more.

Many Housing Propositions are Under Way

The urgent need of more dwelling houses in various cities and towns of Ontario is being felt. In Brantford, Niagara Falls, Welland and other centres the cry is heard for extra accommodation. In the former city the Board of Trade has taken the matter in hand and will launch a company for the erection of a hundred dwellings for workmen. It is proposed to provide funds for the building of a standard type of residence and to sell the same on the installment plan. Funds to the amount of one hundred thousand dollars have already been raised.

In Niagara Falls the city council is giving consideration to the matter of more domiciles and a proposal was made to that body by the Carpenters' Union that all houses built or started this year would be exempted from taxes until 1920. The carpenters thought that this move would encourage building. The legality of the proposition is now being looked into.

In Welland another proposition is under way. A local company will be formed, of which the W. N. McEachren Company, Toronto, will be agents. This company has erected many workmen's houses on the plan outlined in Welland. Two model homes will be put up from standardized plans, and when these are completed they will be thrown open to the public for inspection. Orders will then be taken for duplicates of the model homes and the houses ordered will be built just as rapidly as possible. The advantage of the plan on the part of the buyer is that he will know exactly what he is going to get and what he will be called upon to pay for a domicile, and, on the part of the company, that none except the first two houses are to be built without an order. The buyer will have the advantage of a small payment down and the balance as rental. The Welland Board of Trade has approved of the plan proposed by the W. N. McEachren Company, and it is reported that enough capital has been subscribed already to make the plan a success. Before the war about three hundred houses were put up in Welland annually, but since there has been little done in the matter of building.

In Toronto there is a great demand for houses, especially in the Earlscourt and Oakwood districts. There are twelve firms of builders at work and one will put up thirty houses on land south of St. Clair Avenue.

A recent despatch from Victoria says that Premier Oliver has received word from Hon. C. C. Ballantyne, Minister of Marine, Ottawa, holding out practically no hope that any more contracts for wooden ships would be given by the Imperial Munitions Board, and stating that the programme of the federal government does not include any wooden ships. No obstacles will be raised, however, to the construction of wooden ships for private interests either for allied or neutral registry.

THE MEN BEHIND ASSOCIATION WORK IN CANADA

Live Merchandizing Methods for the Retailer

Secretary of N. R. L. D. A. Emphasizes the Need of System, Service and Aggressiveness—Keeping up with the Requirements of the Times

The lumber manufacturers and dealers of Sarnia, Ont., entertained the visiting delegates to the annual meeting of the Southwestern Ontario Lumber Dealers' Association on the evening of April 16, the event being in the form of a banquet, held in the Board of Trade quarters, with after-dinner speeches and an excellent musical program. The chair was occupied by Mr. John McGibbon, of Sarnia, and all the delegates attending the annual meeting were present, in addition to Mr. C. A. Bowen, secretary of the National Retail Lumber Dealers' Association of the United States, and representatives of the Town Council, Board of Trade, and banking interests of Sarnia.

A brief address of welcome was delivered by ex-Mayor Cook, after which the new president of the association, Mr. W. A. Taylor, of Ridgeway, expressed his appreciation of the honor done him in his election to the office of president for the present year.

Modern Retailing Methods

Mr. C. A. Bowen, of Detroit, secretary of the National Retail Lumber Dealers' Association of the United States, was then called upon and delivered one of the most practical and interesting addresses which the dealers in Southwestern Ontario have ever had the pleasure of hearing.

The first thing, and the main thing, in connection with the business of the retail lumbermen to-day, Mr. Bowen said, was to win the war. All other things must be incidental to this. He believed that in looking over the work which had been done, and which they were now called upon to do, the lumbermen of the country had taken a foremost position, in furnishing materials, money, and men. In the United States the very first to respond to the country's call had been the lumber manufacturers of the South. Within an incredibly short time after the request had been made for materials for the building of ships large shipments were on the way. The retail lumbermen also had been called upon for a great deal, and were devoting their services and their means to the government, in many cases at a good deal of personal sacrifice. There was one duty which they were all called upon to perform and that was to keep their businesses intact and to make sufficient money to be able to furnish it to their country for the prosecution of the war.

"The lumber business, in the retail department, has gone through a number of very important changes in the last few years," Mr. Bowen continued. "There was a time when the retail lumber business was a business where a stock of lumber was assembled and kept for the consumer who might care to use it, and who would come for it. There was not very much effort made to advertise lumber, as it was thought

that it was one of the commodities that people must have. But a change has come about. The very laxity of the methods which were employed for so many years left a wide avenue for the substitute materials, which, in a very large degree, have curtailed the use of lumber in many large building projects. The advertising which these substitute material manufacturers, and the handlers of these materials, have done has been the reason for this large use of substitutes as against the use of lumber, and it is only within the last few months that the retail lumber dealers have been commencing to realize that they, too, must use some different merchandising methods; that they, too, must commence to advertise, and that they must endeavor to induce the consuming public to use their materials the same as the other manufacturers and dealers are doing.

There was a time when the retail lumber business did not require very many up-to-date business methods in its transaction. The prices of lumber were reasonably low, so that there was a fair margin of profit. There was no necessity for such very close figuring. The difficulties in the way of handling, the difficulties in connection with freight rates, and many other difficulties which enter into the business to-day did not make the dealer in those days feel that he had to be a merchant to the same extent as a dry goods merchant or a banker. But that day has passed and the retail lumber dealers are beginning to realize that if they are going to continue in business they must be as good merchants as the man who has a large store on the main street in any town or city. They must be as good business men as the bankers, and they must handle their business in a different manner from that of former days.

Retail Handling Costs

One of the great things which is entering into the retail lumber business to-day is the matter of figuring, handling costs and getting away from the old idea of fooling oneself into the belief that he is making money on a very low percentage added to the manufactured cost. In the United States the government have been considering very seriously, for many months past, the fixing of the prices of lumber at retail, not only to themselves but to the consuming public. The price of lumber from the mill to the government has already been fixed, but there is a demand, and it comes very largely from the farming districts, that the price of lumber to them from the retail yards shall be fixed. They say that the prices at which they can and must sell their products have been fixed by the government, and they are demanding that the prices of the commodities which they are obliged to purchase should also be fixed, and lumber is one of the large factors in the farm-

B. F. Clarke, Glencoe, Secretary of the Southwestern Ontario Retail Lumber Dealers' Association.

THE MEN BEHIND ASSOCIATION WORK IN CANADA

ing districts. And so the government has been looking into the matter with the idea of possibly fixing these prices.

"The attorney of the Retail Lumber Dealers' Association of the United States was in Washington at the time when this subject was first discussed, and when he felt that the matter was serious enough he interposed on behalf of the retail lumber dealers, asking that if it was the intention of the government to take any steps at all towards the fixing of prices of lumber at retail they should not do so until the retail lumbermen had had an opportunity to be heard and to present the figures which would go to make up the handling cost of lumber, so that a price would not be set that would be out of reason and probably very disastrous to the lumber business. The association then took up the matter of trying to get, within a short time, a survey of the yards handling lumber, on the basis of their handling costs. We were amazed to find that a very large percentage of them seemed to have no idea whatever as to what their handling costs were. We found innumerable instances in which the retail lumber dealers were actually selling their stock at a loss, because they had failed to consider extreme costs which they were put to in taking care of their stocks and turning them over. So, after working out a fair sort of basis for a survey, we sent broadcast to the retail lumber dealers, particularly in the larger centres, a circular upon which they might give us a report, as nearly correct as possible, of what their actual costs were. Some of the reports which we got back were ridiculous. Those which were at all intelligible were filed away, and in every case in which the figures approximated the correct figures we received a letter saying that the dealers themselves could not believe that the figures they were submitting were correct. They were so far above any conception they had of what it was costing them to do business that they were astounded. Our reports have not yet been completed. We have been endeavoring to get a more condensed and more complete report, and the government have kindly given us a little more time.

"I am sure that the conditions in the United States are not different from the conditions in Ontario, and I have been wondering just what the dealers over here have been doing in this matter of ascertaining their costs, not only for their own benefit, but also for the benefit of your government if you should be asked to lay before them any figures in this connection.

Doing Business at a Loss

From the reports which we have been able to cover, and which we feel are reasonably correct, we find that the average handling cost, based upon the selling price, is about 24 per cent., and we find that the dealers have been trying to do business on anywhere from 10 to 15 per cent., and those who were going a little higher than that, and none of them over 20 per cent., felt that they were taking a tremendous risk, and so were asking a great, big price. We know that in many instances dealers have actually sold at a cost below their competitors, simply because they had purchased at a time when the price was low, failing to take into consideration, for one moment, that they would not be able to replace that stock at anything near what they had paid for it. We have found dealers who were not figuring one cent for their depreciation, not one cent for their own salaries, not one cent for their

rent because they owned their own property, not one cent for collection costs, nor charging off anything for bad debts.

"Just think of these conditions! Any business man knows that all these things must be taken into consideration. It may be that it runs up the cost of the handling of your lumber higher than you think it ought to be, but, nevertheless, if you are honest in your figuring there is no question that you will find it is costing you considerably more to do business than you have realized, unless you are different from most of the lumber dealers in the United States. Dealers in the large cities have been just as lax in these things as the dealers in the smaller centres. In Chicago they had meetings night after night for months, and they nearly came to blows over their differences of opinion, until finally they began to realize that the matter was serious, and that if they could not work these things out themselves they ought to call a public accountant to do it for them. Many cities are now in the throes of a survey by public accountants for this purpose."

Mr. Bowen then presented a schedule for working out costs which had been prepared by his association as a result of the extensive study they had given to the subject. Copies of this schedule were handed to all the members present, and Mr. Bowen explained it in detail. It is believed that this schedule includes all that is to be taken in when arriving at handling costs in connection with a retail lumber business. Certainly, he believed, any dealer who would study his costs on this basis would be surprised at the light which he would obtain upon the methods of doing business which he had been using. The schedule is as follows:

SURVEY OF MERCHANDISING COSTS For One Year Period, From to

	Total amount.	P.C. of sales.
1. YARDING		
Includes wages of superintendents, foremen, tallymen, sorters, laborers, watchmen, and all other expenses pertaining to the handling of lumber in and out of yard.		
2. CARTAGE		
Includes barn bosses', teamsters', and truck drivers' wages, horseshoeing, wagon repairs, feed bills, gasoline, oil, auto supplies and repairs, and all other expenses pertaining to the delivery of lumber.		
3. SELLING		
Includes salaries and expenses of all kinds, of all employees handling sales; also all commissions paid and all advertising.		
4. COLLECTING		
Includes all collectors' salaries and expenses; also all legal and agency expenses.		
5. ADMINISTRATIVE AND EXECUTIVE EXPENSES..		
Includes salaries of principals of firms or officers of corporations; also all other office employees other than those handling selling and collecting.		
6. CASH DISCOUNT—Paid in excess of amount received...		
7. INSURANCE—Annual amount of premiums		
Includes premiums for all kinds of insurance carried.		
8. TAXES AND LICENSES—Annual amount		
Includes personal property and government taxes; also city license.		
9. RENT		
The actual rent paid is to be used. If under lease, then		

Allan S. Nicholson, Burlington, Secretary of the Western District, Ontario Lumber Dealers' Assn.

J. A. Laberge, Sudbury, Secretary of the Northern District, Ontario Lumber Dealers' Association.

A. J. Jordan, Sudbury, Secretary of the Georgian Bay Lumbermen's Association.

THE MEN BEHIND ASSOCIATION WORK IN CANADA

include whatever taxes, improvements, or other assessments the lease requires you to pay. If your yard site is owned in fee simple, then use an amount which the site would bring if rented to others for similar purposes. Ten per cent. of the assessed valuation is considered equitable.

10. INVESTMENT—Interest 6 per cent. per annum
On capital stock, to the extent that it is paid up, plus surplus, if any. Capital stock and surplus represent investment, and the sum of both is considered as chargeable with 6 per cent. per annum.
11. INTEREST—Paid in excess of amount received
12. DEPRECIATION—Total consisting of:
(a) At 10 per cent. per annum on original costs of office fixtures, sheds, stables, garages, planing mills, and switching tracks
- (b) At 20 per cent. per annum on original costs of horses, wagons, automobiles, and all other equipment of every kind and character used in the business
- (c) At 2½ per cent. per annum on the value of the average stock of lumber, etc., carried during the year.....
13. BAD DEBTS—Estimated at ½ of 1 per cent. on sales
14. DRESSING
Cost of dressing and re-manufacturing any and all lumber handled during this period.
15. POSTAGE, TELEPHONE, TELEGRAMS, STATIONERY, AND ALL OTHER INCIDENTAL EXPENSES
16. TOTAL COSTS
17. TOTAL SALES
18. TOTAL PERCENTAGE

A schedule of this kind could easily be worked out, regardless of the kind of bookkeeping used. With a very little figuring, the different items could be searched out and charged under the different heads. The association had gone on the basis of a percentage. They believed that this was the only correct way to arrive at the actual cost of handling lumber, and not the dollars and cents proposition.

"We believe that this is a very important matter," Mr. Bowen continued. "If the retail lumber dealers do not know what their actual handling costs are it is time that they were waking up to this very important matter. It required the war to waken them up in the United States to this matter.

"There is another thing that the retail lumber dealers are not doing. They are not being merchants as they should be. You know what the average lumber yard is. It is a site down by the railroad tracks. It is usually hard to get to. It is not very often an attractive place for people to go to. There is no particular inducement for women to go to the office to enquire for lumber. You have never gone in for attracting them in that way, nor the men either, for that matter. Yet to a very large extent, particularly in the building of homes, it is the women with whom the business is done.

"There is one line of yards in the States which has made over all its yards. They have all been made attractive. Offices have been opened on the main street of the town, with all sorts of samples and plans. Their yards are all plotted out and have flower beds in the summer time. If the manager does not keep the property in just that shape all the time they have no use for him.

"I believe that the retail lumber merchant of to-day must commence to realize that he has a service to sell; that he must furnish that service if he expects the consuming public to come to him and buy his wares. Let the service be the main thing and the lumber will sell itself. When the retail lumber merchant commences to know his handling costs and to ask the right prices there will not be the same cut-throat conditions that there are to-day, and the lumber dealer will commence to know that he ought to be in the front rank of the retail merchants of his community. Then he will not only commence to be of value to his community, but he will be giving to the consumer a dollars and cents proposition, which he is not doing at the present time.

"We must wake up to the needs of the times better than we have. The cost survey is one of those things which we must talk and talk about in order to get it to the point where we want it. It is going to take a considerable amount of work to get it right down into their inmost souls, but that is what we have to do.

Association Work Coming Into Its Own

"We feel, so far as our association is concerned, that under present conditions it is just the time to get the dealers more interested in association work. They are going to have more time to get together and work these things out. There is nothing better in the world than to get together and frequently discuss your feelings about business. If you bring one idea to the meeting you will surely take two ideas, or many more, away with you; and if the spirit is there, the value of this thing cannot be computed in dollars and cents. The value of an association consists in getting men to think of these things; not to consider them as side issues.

"There never was a better time for association work than now. I believe that association work is coming nearer and nearer into its own. I do not believe that there is an intelligent man anywhere to-day who will not admit that association work is the only way to achieve success. They are coming into the associations in larger numbers than

ever before. The small amount of money asked by the associations as dues is infinitesimal compared to the value that the members get out of it. Dealers are beginning to learn that not only do they owe their dues, but their thoughts, their efforts, and their time to the work of their associations."

At the conclusion of Mr. Bowen's address a few words of welcome were given by Mr. Kenney, president of the Sarnia Board of Trade, after which Mr. A. E. Clark, chairman of the Wholesale Lumber Dealers' Association, Inc., was called upon.

The Wholesaler's Interest in the Retailer

Mr. A. E. Clark, Toronto, extended greetings to the retailers from the Wholesale Lumber Dealers' Association, Inc. He felt that they were gathered together for an occasion upon which the retailers had great reason to congratulate themselves, as it was an evidence of the enthusiasm which they had shown in endeavoring to get together and eliminate the difficulties which continually arose in the retail lumber business. Difficulties were creeping in all the time—difficulties arising out of government ownership, government control, socialistic developments on the part of the labor elements, some of which were verging upon anarchy, and many other difficulties, all of which made it important for them to take care of their own interests, and this could best be done by means of association.

There was too much of a tendency to look upon associations from a selfish point of view. They should consider that it was necessary to go into association work with the idea that, although they would gain considerably by their membership, they should also be willing to give up all they could for the common good. When they had ideas which would be of benefit to the association they should give them up just as freely as they expected to get other ideas from the association. If any man joined an association with the idea that he was going to make a personal gain only, he would be a detriment to the association. Everyone should welcome the spirit of hearty trade rivalry. It was necessary to a certain extent for the welfare of the trade, but the system of securing business by cut-throat methods was not necessary at all. There was business enough to go round, and it could all be done in a legitimate manner without creeping in and cutting the heart out of everything in order to get the business.

Mr. Clark touched upon the question of trade ethics. He did not believe, he said, that it was a proper thing to slip into your neighbor's territory, twenty miles or more down the line, and put a car in there. The principles of trade ethics must, sooner or later, enter into the affairs of every business man. Whether they were manufacturers, wholesalers, or retailers of lumber, they had a great many things in common. Their first object was to place lumber on the market at a reasonable cost, and with an adequate amount of profit for themselves. They had to protect themselves against substitute rivals who had been taking trade away from lumber. These rivals had been creeping in, largely because of the careless business methods of lumbermen and because, individually, the lumbermen were not strong enough to compete against these influences. As an association they could demonstrate that there were no substitutes for lumber in the ordinary building trade. To do this they would have to pursue the same methods as their competitors. One of these methods was the use of constructive advertising. Another was the attractive arrangement of yards. The average lumber yard in Canada was anything but a desirable looking spot. The dealers did not even make good use of the few facilities which they had. The practice was to throw a few piles of lumber into a yard, and sit down in the office. Then if a fellow came along and bought, all well and good; but if he did not come, then we thought we had a right to kick.

The lumberman had not been business-like in his methods of salesmanship. Many of the wholesalers' men upon the road were not salesmen. They carried a stock sheet, but if they were asked to describe anything that was not included in the list they could not do so. Very frequently the same thing prevailed in connection with the retail business. The sooner they elevated the trade so that they would all know how to sell, who to sell to, and what to use the stock for, the sooner would the business be in the hands of men who were real lumbermen.

There were a number of trade difficulties which had been considered as purely wholesale difficulties, but in which the retailers were also interested. Such matters as increased freight rates and stop-off charges for dressing came under this head. The wholesalers had been endeavoring to fight the increases and restrictions of this nature that had lately been brought forward whenever they felt that they were unjust. They felt that the retail association could do a great deal in the way of supporting the wholesale association in fighting against many of these conditions. They had felt that the labor organizations of Ontario had had a far greater voice in developing the Workmen's Compensation Act than any of the other bodies that were interested in it. The retail lumbermen ought to have something to say in connection with the distribution of these funds.

Mr. Clark touched next upon the matter of credit, suggesting that the retailers should give it a little more study. If a retailer went to the

bank and asked for a hundred dollars, saying that he would pay it back "when he could," how much would he get? Why should the retailer not sell his lumber in the same way as the banker sold his credit? The farmer was making money, and many others were making money in Canada to-day, and they were quite able to pay on short-date terms.

In conclusion, Mr. Clark congratulated the retailers upon the success of their association, and expressed the hope that it would continue to grow, and would co-operate with the Wholesale Lumber Dealers' Association and the Canadian Lumbermen's Association in placing the lumber business of Canada among the foremost in the country.

Mr. H. Boulton, secretary of the Ontario Retail Lumber Dealers' Association, was the next speaker. He told of the excellent progress which the association is making, both in the matter of membership and the importance of the work which it has undertaken. He drew attention also to the encouraging manner in which the retailers and the wholesalers are co-operating through their associations, and expressed the belief that the outlook for lumber association work in general in Eastern Canada had entered upon a new and a very promising era.

Mr. W. A. Hadley, of Chatham also spoke briefly. Votes of thanks were passed to the speakers and those who had had the arrangements for the meeting and the dinner in charge, and the meeting then adjourned.

Southwestern Retail Lumber Dealers Convene Enthusiastic Meeting Held at Sarnia Receives Greetings from the Wholesalers— Selling Lumber to Farmers' Clubs Should be Abolished

The annual meeting of the Southwestern Ontario Retail Lumber Dealers' Association, which constitutes the southern district of the Ontario Retail Lumber Dealers' Association, was held at Sarnia, Ont., on April 16. There was a large attendance of dealers from all parts of the district, including C. A. Hubbell, Thamesville, president, who occupied the chair; B. F. Clarke, Glencoe, secretary; D. J. McEachren, Alvinston; A. W. Osborne, Essex; John McGibbon, Sarnia; C. M. Smith, Aylmer; Chester H. Belton, Sarnia; P. G. Piggott, Chatham; J. C. Scofield, Windsor; E. C. Russell, Walkerville; Allan McPherson, Glencoe; Mr. Huston, Dresden; W. Daniels, Chatham; P. L. Canfield, Woodstock; R. W. Belton, Sarnia; W. A. Saurwein, of the Cleveland-Sarnia Sawmills Company, Sarnia; A. E. Ludlam, Leamington; W. A. Hadley, Chatham; W. J. Taylor, Ridgetown; Mr. Burge, Sarnia; F. Villeneuve, Walkerville; L. Travis, Wyoming; Frank Reid, Toronto; A. E. Clark, Toronto; L. Richards, Sarnia, and E. A. Lebel, Sarnia.

The business of the afternoon meeting was largely of a routine nature. The election of officers resulted as follows:

President—W. A. Taylor, Ridgetown.

Vice-President—W. A. Hadley, Chatham.

Secretary-Treasurer—B. F. Clarke, Glencoe.

Executive—D. J. McEachren, Alvinston; A. W. Osborne, Essex; John McGibbon, Sarnia; William Saunders, Dutton; C. M. Smith, Aylmer; and George H. Belton, London, with power to add four more members to represent other parts of the district as new members are secured.

After the election of the new president, Mr. Hubbell, the retiring president, expressed his appreciation of the co-operation which he had received from the members of the association during his two years' occupancy of the president's chair. He then vacated the chair in favor of the new president, and Mr. W. A. Taylor presided during the balance of the meeting.

Mr. A. E. Clark, Toronto, chairman of the Wholesale Lumber Dealers' Association, who attended the meeting as a guest, was then invited to address the members. Mr. Clark expressed the pleasure he felt at having an opportunity to address the retailers and at seeing that the dealers were at last realizing that they had as good a right to carry on a progressive trade as any other business men. In the past the lumbermen had scarcely figured that they had a right to live. Associations of almost every description existed to promote the interests of other lines of business, but until very recently the lumbermen had gone ahead on their old cut-throat principles. The lumber business had been based largely on the idea that the most important thing was to get the business. A few months after getting an order they generally had an opportunity of finding out how much they had lost on it. The Ontario Retail Lumber Dealers' Association should be able to work out great benefits to its members by educating them out of this way of conducting their business affairs.

As chairman of the Wholesale Lumber Dealers' Association, Mr. Clark assured the dealers that the wholesalers desired to work in as close harmony with the retailers as possible. The demarkation of the boundary between the wholesaler and the retailer had long been a very contentious matter, and he hoped that the two associations might be able to work out an understanding upon this subject which would enable them to get along far more harmoniously in the future. He would like to see the retailers get their association in such good shape that it would be able to take care of all the important matters that required co-operative work, if they were to be dealt with effectively.

Value of the Provincial Association

Mr. D. J. McEachren, Alvinston, opened an interesting discussion on the work of the association. He expressed vigorously the conviction that the local association should preserve its identity and deal

with all matters of a local nature which came up for discussion. On the other hand, he realized the great advantage there was in having a provincial association, composed of all the local associations, and he believed that it was the duty of all the dealers to join the provincial association and do their best to assist it in its work. The retailers desired to earn and deserve the confidence of the wholesalers and to get into closer touch with them. For this purpose organization was essential.

There was something wrong, Mr. McEachren asserted, when the wholesaler would sell to the farmers' clubs. It created a bad feeling among the retail trade, and he believed that the way to remedy this trouble was to get into closer touch with the wholesalers and persuade them not to sell in this way. The wholesaler should deal directly with the retail dealer and not with every man who came along.

Mr. A. Ludlam, Leamington, spoke of the value which the provincial association would be to the retailers in providing a means of dealing with matters of general importance, which a local association could not handle effectively. One of these matters was the Mechanics Lien Act. The retailers wanted the provincial association to take up this matter and have the act changed so that it would protect them. As to the farmers' clubs, it was his opinion that their influence would not be great, and that they would not be worth bothering about to any great extent. The provincial association would also be of assistance to them in connection with the Workmen's Compensation Act. There were many things about the act that some of them did not understand, and the provincial association should be able to approach the compensation board for them and help greatly in any negotiations with the board that were necessary.

A discussion then took place regarding the matter of finances for the local association, and on motion of Mr. W. A. Hadley, seconded by Mr. D. J. McEachren, it was carried that the annual fee of the local association should be five dollars a year, and if the expenses amounted to more than this fee would meet, they should ask the provincial association for a portion of the sum of \$100 voted for paying local expenses in securing members for the provincial association.

A discussion on the way in which the farmers' clubs are operating then took place, and Mr. W. A. Hadley gave an interesting description of some things which he had found out about these clubs.

Mr. E. C. Barre, of the Cleveland Sarnia Sawmills Company, Sarnia, who was a guest at the meeting, expressed his pleasure at being present and spoke of the desire of the legitimate wholesalers to deal with the retailers direct. None of the legitimate wholesalers wished to sell to the contractors. It might happen on an odd occasion that they would make such a sale on account of some peculiar circumstances, but if they did they always got five or ten dollars more for the stock. Mr. Barre stated that he had had many letters from farmers' clubs, and it had been his company's policy to forward these letters to the local retailers. In every case the retailers had accepted this service very gracefully.

The wholesaler, Mr. Barre said, had to depend very largely upon the retailer for his business, and he ought, in return, to protect the retailer in every case.

Votes of thanks were then carried to the visitors who had addressed the meeting, and to the Cleveland-Sarnia Sawmills Company, the R. Laidlaw Lumber Company, and F. McGibbon & Sons, of Sarnia, for the efforts which they had made to give the delegates and guests a pleasant time during their visit.

The business meeting then adjourned, and as there was a short time available before the hour for the evening banquet, the members were taken in automobiles for a visit to the mills of the Cleveland-Sarnia Sawmills Company and the yards of the R. Laidlaw Lumber Company and F. McGibbon & Sons.

Current Cost Plan Has Many Objections

Not Endorsed by Best Authorities on Compensation Laws—Sawmills and Logging Rates in Ontario Lower Than Those of Other States

"The Workmen's Compensation Board does not wish to enter into controversy, but desires to give any information which will assist employers or lead to a better understanding of the matters mentioned in the discussion and proposals of the Canadian Lumbermen's Association in connection with the Act as reported in the "Canada Lumberman" of February 15 and March 15," writes the Chairman, who was recently asked for certain detailed information with respect to the operation of the Act as applied to sawmills and logging operations. Certain phases of the measure have been criticized and in connection with the points raised the following statement has been obtained:—

The so-called Current Cost plan is considered unsound and objectionable, as it leaves part of the cost of the accidents now happening to be provided for in the future instead of having the employers who are responsible for them pay for them. An article discussing the matter will be found at page 39 of the Report of the Board for 1916, which will be sent to any employer requesting it. The cost of accidents is a working or running expense and in no sense a capital expenditure. It would seem hardly less reasonable to leave part of the workmen's wages to be paid in the future. The so-called Current Cost system is in vogue chiefly in Germany.

It is generally condemned by the best writers and students of compensation laws on this continent, and no place could have less reason or excuse for adopting it than Ontario, for the rates in Ontario now are incomparably lower than those of any other place paying similar benefits to the workmen. Taking for convenience the tabulation made by Mr. Watson, Actuary of the Ohio Board, and published in the December Bulletin of the Industrial Commission of Ohio, we find the rates to be as follows:—

	Logging	Sawmills
New York	\$9.14	\$9.54
California	5.97	4.97
Illinois	7.45	7.78
Wisconsin	4.82	7.62
Indiana	7.09	7.40
Michigan	6.48	6.77
Kentucky	6.19	6.47
Colorado	4.80	5.02
Pennsylvania	4.35	4.16
Ohio (Preferred Rate)	2.15	3.85
Ontario (1917 Preferred Rate)90	1.10
Ontario (1918 Provisional Rate)	1.20	1.50

Assessment Based on Capitalized Claims

When the Board was adopting its present system the author of the paper, which was read at the Lumbermen's Convention, told the Chairman he was not opposed to the principle of capitalization; and a letter from the Attorney-General written February 25, 1916, after an interview with the author of the paper, states that the lumbermen's and pulp and paper makers' interests "are not averse to having an assessment based on capitalized claims"; and according to the minutes of a meeting of the Lumbermen's Safety Association, held March 2, 1916, the President (Mr. Thomas), in his address, stated that "the principle has been established that the rates struck from year to year are to be sufficient merely to cover the current cost with deferred payments capitalized, and a small reserve." This is precisely the system that is being carried out, and so far as appears no objection was then raised. The small reserve is merely what is called a Disaster Reserve amounting to only one per cent. of the total assessments collected.

To permit employers to carry their own insurance would be a radical departure from the principles of the present Act. Among the places for which rates are above quoted, Ontario and Ohio are the two places in which the law is an exclusively state insurance law, and it will be noted that these are the two places in which the rates, generally speaking, are lowest, though both of them are paying more liberal compensation than a number of the others, and especially more liberal than Pennsylvania, Michigan, Colorado, and Indiana. The fair assumption seems to be that the exclusively state insurance system will result generally in a much lower rate than either the mixed or solely individual insurance system.

The question of putting the matter of medical aid under the jurisdiction of the employer was discussed at the conferences which were held by the government with the representatives of the employers, of the workmen, and of the doctors, when the medical aid provisions of the Act were being considered. The proposition was then made by the employers, but was objected to by the workmen, and as a result the provisions as they now are were adopted and passed by the Legislature. It is not a matter in which the Board has any option but to carry out the law as enacted.

Upon the desirability of an appeal the Board is perhaps not in the best position to judge. When the Act was drafted by the present Chief Justice of Ontario he thought the reasons good for allowing no appeal, and this feature has been followed in both the British Columbia and Manitoba Acts, and with but very slight exception also in the Nova Scotia Act. The establishment of appeal would, to at least a great extent, bring back the condition of things that existed when questions between employer and workmen were dealt with by the courts prior to the passing of the present law. The Workmen's Compensation Act in Great Britain, where appeals are allowed, is described by the president of one of our leading universities, who is familiar with the working of the law there, as having given new life to the legal profession.

The Present Degree of Control

The recommendation made by Mr. Thomas "that the Safety Associations should be removed from the control of the Board under which they have fallen" is hard to understand. These associations are not, and have never been, under the control of the Board, except that the Board in making grants to them has endeavored to keep the expenses down within reasonable limits and to avoid granting money for purposes not authorized by the Act. There does seem objection, however, to mixing safety work with controversial and contentious matters. As to this matter, a letter dated March 26, 1918, has been received from Mr. Thomas saying: "I did not imply, and I am satisfied that my hearers did not understand, that the Board interferes with the details of management of these associations, far less did I complain of any measure of control that is exercised. . . . I am free to say that, so far as my observation goes, it (the control by the Board) has been most wisely exercised, and has made for economy and efficiency in the operation of these associations. . . . I should be sorry to see the present degree of control by the Board abolished."

Proposal to Alter Seven-Day Clause

The alteration of the seven-day clause is a matter worthy of consideration. The proposal before made to make the seven-day waiting period absolute was very strenuously opposed by the workmen's representatives. The suggestion to eliminate it altogether or reduce it to a shorter period has much to recommend it. The broad statement as to constant malingering is not justified. The Board is always desirous of getting information as to specific instances. A general statement is of no assistance. Such general statements when sifted are usually found to have little foundation in fact. Some malingering, of course, there will always be, but the Board does its best to prevent it, and must in the nature of things depend to a great extent upon the employers for assistance. The employer is always asked in his reports of accident and otherwise to bring the facts, or even his suspicions, to the attention of the Board.

Suggests Airplanes for Coast Forests

If the suggestion of E. J. Palmer, of Chemainus, B.C., is adopted, the forest service of the Pacific Coast province will conduct its coast fire protection and detection operations by the use of airplanes next year. Mr. Palmer contends that there are a large number of machines discarded by the Royal Naval Air Service as no longer in the running for active war duty, and believes it would be possible for the government to prevail on the authorities at Ottawa to secure from the Imperial Government several such machines at a nominal cost. Returned aviators not in condition to permit them to engage any further in aerial warfare would doubtless be available for the duty of forest rangers of the air on this coast.

Desire Uniform Price for Shell Boxes

A meeting of shell box manufacturers was held recently in Ottawa to talk over the shell box contract situation, and come to some conclusion whereby plants tendering would provide for and include overhead expense and actual operating expense, thereby protecting themselves against ultimate loss.

For some time past it has been a matter for discussion how some plants could tender so low, and cover operating costs, material, labor, etc., and make any money on their contracts. Competition was undoubtedly keen, and a number of firms, in their eagerness to secure contracts, evidently failed to include in their figures all the factors necessary to arrive at the proper cost.

Naturally, a plant that took into consideration all actual operating charges, and allowed for a fair and just profit above cost of manufacture would arrive at a figure higher than the plant which overlooked, or temporarily forgot to include some actual operating costs in its summary. Again, a plant with a plentiful stock of lumber suitable to meet the specifications, would be enabled to figure lower than ones who had to go out in the market and purchase their stock. The plant with a supply of lumber purchased at low prices or produced at lower cost could enter this item at a lower figure than the plant buying lumber at market quotations, and thus lower its tendering figure.

The question with many woodworking plants since the outbreak of the war has been: "Is it better to completely close, or greatly reduce the operation of the plant, or take on shell box orders?"

The position of the Imperial Munitions Board, naturally enough, was to accept the lowest tenders, complying with the specifications. Thus through time and changing conditions it has developed that some plants, owing to their circumstances or method of cost figuring are able to figure lower than others, and secure contracts. Competition appears to have forced down the price to such a level that it began to cause concern as to, whether or not it would be wise to continue manufacturing shell boxes at the prices paid by the Imperial Munitions Board?

At the Ottawa meeting the shell box manufacturers represented arrived, it is said, at a minimum price which they would not go below in tendering.

After, or before, the minimum price was decided upon, it is reported, some manufacturers went to the Imperial Munitions Board and asked that the Board set a price on shell boxes, and distribute the contracts among all the mills. On this basis a mill with a big capacity allowing profit over cost of manufacture, would derive more monetary benefit than the smaller plant. The Imperial Munitions Board refused to set a figure and apparently was content to continue the policy of calling for tenders on all contracts.

Contracts were let a few days after the meeting to several firms, but none of those represented at the gathering are known to have secured an order. The prices at which the contracts were let are reported to have averaged around \$1.18 per box. Formerly the figures ranged from \$1.05 to \$1.07 per box.

Will Get Some Reward for their Work

Pulp timber license cruisers who in cruising areas for pulpwood find valuable bodies of airplane spruce or other timber, but are unable to get the license because they are outbid, will be paid for "actual and necessary expense," says a new amendment in the Forest Act, which was recently introduced in the British Columbia Legislature.

Hon. Mr. Patullo, Minister of Lands has found that in several cases recently cruisers who found valuable areas of spruce in the pulp lands they had cruised were unable to get the license at the customary tendering owing to the fact that they were outbid when it was found that the areas held spruce of airplane quality. The new amendment will provide that if the cruisers were bona fide, but unsuccessful tenderers, the Minister may pay their cruising expenses.

The bill contains another provision giving the Minister of Lands authority to set apart any portion of land within a special timber license, if he finds it suitable for settlement. Under the present Act the Minister could only set apart the whole of the land covered by the special license, thus limiting the opportunity for using some of the land for settlement and the remainder for timber purposes.

Death of Widely-Known Lumberman

Mr. Hugh P. Blair, one of the oldest and most esteemed lumbermen in the Province of Quebec, died on April 12, at 182 Belgrave Avenue, Montreal, after four days' illness, aged 70 years.

Mr. Blair came from a family of lumbermen, his father, the late Mr. Robert Blair, being a pioneer in the industry on the Saguenay River. Mr. Hugh P. Blair's early life was spent in that district, where he learned the business. In 1867 he was employed by the firm of Price

Brothers & Co., and in 1882 was manager of their business at St. Etienne du Saguenay. While there he put in force what is known as the daylight saving scheme, advancing the mill clocks one hour, in order to obtain the benefit of additional daylight.

In 1892 he was appointed manager to Mr. Alexander Baptist—another lumber pioneer—at Baptist Island, Three Rivers, and remained there until 1911, when Mr. Baptist sold the limits to the Wayagamack Pulp and Paper Company. Following his appointment as manager to Mr. Baptist, the timber resources of the St. Maurice Valley were largely developed, and it was mainly due to Mr. Blair's knowledge and efforts that these resources became more widely known and appreciated. Many other industries have been gradually built up there, and the district is now one of the most prosperous in the province. Mr. Blair was also instrumental in forming the St. Maurice Log Driving Association, by which logs are co-operatively driven instead of by individual lumbermen.

Mr. Blair is survived by Mrs. Blair and four sons and one daughter (Mrs. George Earle Baptist). The four sons are all in the lumber trade—Messrs. R. P. Blair, of Ottawa with Hughson & Co.; Albany, N.Y.; W. B. and H. C. Blair, of Blair & Rolland, Montreal; and O. T. Blair, now with the Canadian army forces.

New Lumber Association Suggested

The proposal of the mining and lumbering committee of the Chambre de Commerce, Montreal, to establish an association of private holders of forest properties created some discussion at a recent meeting of that organization. The report was presented by Mr. Frank Pauze, chairman of the committee, who stated in support of his recommendation that the value of private lumber properties in Quebec was thirty million dollars, but that these people had no organization to guard their interests, whereas the corporate holders were properly organized. The recommendations of the report were in the direction of forming an association of lumber producers (Syndicat des produits forestiers), which would be authorized for a period of ten years to issue warrants payable within a year, good in the province of Quebec only. These warrants would represent lumber products—lumber of various varieties—delivered for commercial purposes. The committee argued that the producer, the merchant and the consumer would benefit by their scheme, the first by assurance of payment on delivery, the second by being assured of supplies and delivery, the third by fixed measures and reasonable prices.

The discussion centred principally around the question of the initiative and as to the guarantor of the warrants. The committee wanted the Chambre to take the initiative, but one member thought the government should be asked to back up the project and guarantee the warrants. Finally, the report was referred back to the committee.

Shingle Mills are Fairly Active

While about 85 per cent. of the shingle mills of British Columbia are in operation just now, not many of them are working to full capacity, as was the case this time last year. Prices have stiffened since last year, but there is not the same demand as in 1917, when shingle manufacturers enjoyed the best year they ever had in British Columbia. One thing mitigating against a big cut so far this season has been the inability to get shingle bolts down to the salt water. When the weather breaks this difficulty will be overcome. The car

Mr. Stevenson is Appointed Director

Mr. T. J. Stevenson, sales manager of the Riordon Pulp and Paper Company, Montreal, has been appointed a director of the company. He has been connected with the company for 35 years, and has risen to his present position from a junior clerkship. Mr. Stevenson is courtesy itself, and his very wide circle of friends in the lumber and pulp industries will congratulate him upon his election to the board. There are few men with a wider knowledge of the practical, economic, and selling aspects of the pulp trade than Mr. Stevenson.

Possibilities of Sawmill Waste

In a recent address before the Society of Chemical Industry in Vancouver, A. Hallden touched upon the reclaiming of wood waste. He said that in logging and cutting the logs into lumber there is a big waste of wood in woods and sawmills. Providing the market were found, charcoal could be made of part of this waste, at the same time recovering chemical products from the tar and gases from the coal ovens. Charcoal has just been made on a small scale in British Columbia. A small quantity of potash can be recovered from the waste burners at sawmills operating on Douglas fir. Alcohol may also be made direct from wood waste by cooking same with diluted sulphuric acid, fermenting and distilling the mash, using the cooked chips for fuel.

McRae of Canada, is Soldier "Hustler"

A. D. McRae, of Vancouver, B.C., Canadian Quartermaster-General.

General A. D. McRae, the Canadian Quartermaster-General, has been appointed Director of Organization in the new Ministry of Information. "Who's McRae?" men ask. "Why should a Canadian be chosen to organize Imperial propaganda?" says a recent edition of the Daily Mail, of London, Eng.

Tall, clean shaven, well built, with shining head, somewhat long face, a ready smile, and a slight mid-American accent—that is McRae. Forty-three years of age, he was born in Glencoe, Ontario, of Scottish-Canadian descent. When he was 19 he went to Duluth with £200 to make his fortune. He spent the £200 and then began work in earnest. Before long he had built up one of the biggest insurance enterprises in the West. He helped to estab-

lish a group of rural banks, and when he was 29 he returned to Canada at the head of land enterprises.

The West was then at the height of its "boom," and McRae rode on the crest of the boom. He organized the immigration of American farmers into the West—largely in connection with the Canadian Northern Railway—running special trains and selling them land. He is said to have settled more men in the West in recent years than anyone outside the Dominion Government itself. In due course he went to the Pacific Coast and made his home at Vancouver. Here he became head of many enterprises, notably lumbering and deep-sea fishing. Characteristically, he kept all his old work, from insurance to land development, going at the same time. He is a former vice-president and general manager of the Canadian Western Lumber Company, Fraser Mills, B.C., operating the largest sawmills in Canada, and is still financially interested in this organization.

Then came the war. McRae's one passionate hobby is horses. The Canadian Government needed horses, and he was asked to become one of the buyers. Later he was sent to England to look into the horse situation there. He cleaned it up in a very remarkable way and was asked to do more.

Canadian supplies and transport were in a very disorganized condition. Would he see what could be done with them? One incident may show his methods. He found that the troops were having too much food and that much of it was wasted. Accordingly he started to have men trained to cook properly and cut the ration of meat from a pound a man a day to three-quarters. There came immediate trouble, not from the soldiers, but from the higher British authorities. "A pound a day was the allowance. It must be used." But he overcame even the British authorities.

There was still waste. So he established the famous Canadian Army ration system. He had fish brought over wholesale from Canada; he directed what every meal was to be, how it was to be cooked, and how the waste was to be utilized. The Canadian Army to-day is the best fed and the most economically fed army in Europe.

In the big Canadian reorganization of December, 1916, McRae became Quartermaster-General. He now carried out the same principles on a bigger scale. For example, he found enormous quantities of surplus and obsolete stores. Why leave them till the end of the war? He negotiated with governments, fixed deals with contractors, and obtained for them four or five times what they would fetch when the war is over.

The Imperial Government began to mark him, as it is noting a number of other young men from the Dominions to-day. It was notorious that the different departments of propaganda needed a business organizer badly. They have got him now. Incidentally he likes the job so much that he is paying his own salary.

The Value of C. N. R. Timber Lands

At the Canadian Northern Railway arbitration sitting in Toronto recently, some important evidence was given regarding the value of the timber lands of the company in the province of Quebec. Gustave Piche, of the Department of Lands and Forests, Quebec, stated that on the sale of ordinary pulp wood licenses, the average price realized last year was about \$430 a square mile, this being equal to seventy cents an acre. The pulp wood consisted principally of spruce and some balsam, and averaged about seven cords to an acre. He added that he was aware that the statutes provided for the sale of land at

two and a half dollars per acre, the purpose being to induce greater settlement. The ground rent for ordinary limits was five dollars per square mile since 1910.

C. E. Taschereau, an expert in the sale of timber lands, was called by the C. N. R. to give evidence in regard to the value of the lands of the railway in Quebec. In reference to certain sales made by the company he stated that as high as \$2.48 per acre for land adjoining markets had been obtained to less valuable land at \$5 per acre. Asked what would be a fair value for land in the case of a railway, which already had a subsidy of 500,000 acres, would be, Mr. Taschereau remarked that it should be worth \$5 an acre, or perhaps a little more for subsidies which are prior to the order-in-council passed in May, 1910; regarding the restriction of the export of pulp wood. Mr. Taschereau said that he valued freehold land subject to the restrictions mentioned at between \$3 and \$3.50.

How Pulp Wood Increased Rapidly in Price

Evidence in an interesting suit was recently heard in Toronto before Justice Lennox when Austin and Nicholson, of Chappleau, Ont., entered action for \$15,000 damages against the Canada Steamship Lines for alleged breach of a contract to carry several thousand cords of pulp wood from Michipocoten on Lake Superior to the Ontario Paper Company at Thorold, Ont. The case was adjourned by the Court in order to hear the argument of counsel.

It appears that Percy C. Deeble, a pulpwood broker, entered the negotiations by selling 5,000 cords of wood that he had bought from the plaintiffs to the Ontario Paper Company. He told of the advance in price of wood from \$8 to \$18 a cord, delivered, during the summer of 1916. After making the sale to the Ontario Paper Company he went to H. W. Cowan, at that time operating superintendent of the Canada Steamship Lines, and got the alleged contract to carry the wood at \$2.25 a cord, on which the action was brought. Cowan denied that it was a contract. He claimed that Deeble had come to him asking for a letter to be shown to the Ontario Paper Company to convince them that the wood could be delivered to them. When Deeble withdrew from the transaction that the plaintiffs might deal direct with the purchasers, the letter was given to Austin & Nicholson.

Want Black Sturgeon Concession Cancelled

The sixty-ton pulp plant of the Port Arthur Pulp and Paper Company, at Port Arthur, Ont., which is now in operation and employing two hundred hands, is regarded as a decided industrial acquisition by the residents of the northern city. To signalize the first anniversary of the plant, a public banquet was held recently under the auspices of the Board of Trade, at which several congratulatory addresses were made. The Port Arthur Pulp and Paper Company was felicitated on its enterprise and progress, as it is only a year ago that the first workmen arrived to commence operations on construction. A. G. Pounsford, general manager of the company, briefly reviewed the successful undertaking and stated that if the necessary pulp limits could be secured, the erection of a paper mill was assured. A resolution was passed asking Hon. G. Howard Ferguson to secure as soon as possible the Black Sturgeon limits for the Port Arthur Pulp and Paper Company. About fifteen months ago this concession was awarded to Sam Marks, of Nipigon, by the Ontario Government. The concession consists of one thousand square miles in the Thunder Bay district, and Mr. Marks' bid was for seventy cents per cord for the pulp wood, in addition to the usual fees of forty cents per cord for spruce and twenty cents for other pulp woods. Mr. Marks was to erect a hundred-ton pulp mill on the property and expend two hundred thousand dollars the first year in the work. Owing to nothing having been done, Port Arthur citizens are anxious to secure the cancellation of the contract and see that the concession is handed over to the Port Arthur Pulp and Paper Company, which was an unsuccessful bidder for the limits at the time it was awarded to Mr. Marks in February, 1917.

Transportation Restricted Lumber Operations

According to the annual report of Price Bros. & Company, Limited, transportation problems restricted the lumber operations of the company during the year. The pulp and paper branches were also somewhat hampered from the same cause, and the directors look for a continuation of these conditions during the current year. A new unit was added to the Kenogami mill during the year, bringing the capacity up to 200 tons of newsprint a day, while the Shipshaw Power development was also completed and is supplying the company with 10,000 h.p. The development includes a storage dam with a capacity of nearly seven billion cubic feet. The profit totalled \$1,374,782, as compared with \$1,240,485 in the previous year. Owing, however, to the provision of \$216,353 to cover a fire loss on the timber limits, the balance stands at \$711,452, as against \$805,218. Shareholders received a dividend of 6 per cent. and a bonus of two per cent.

New Rations for Canadian Lumberjacks

Food Department Outlines Suggestions for Controlling Meal Service in Camps—The Details Being Arranged

To consider the suggestions from the Food Controller at Ottawa with respect to the meal services in camps, the rationing of employees and other important matters incident thereto, a special meeting of the Georgian Bay Lumbermen's Association was held at the Queen's Hotel, Toronto, on April 16th. There was a representative attendance, and the regulations as outlined in a recent communication were thoroughly discussed.

W. E. Bigwood, of Toronto, former president of the Canadian Lumbermen's Association, occupied the chair, and the recent memoranda sent by the Food Controller's Department, Ottawa, to the various companies operating camps was read, along with a communication from the Ottawa River Lumbermen. The latter association held a meeting some days previous and a copy of the letter, which was forwarded by them to the Food Controller, endorsing generally the proposals of the Department, was placed before the meeting. A number of suggestions were offered in the shape of minor amendments, and there is no doubt but that the lumbermen and the Food Controller will come to an amicable and satisfactory agreement on the subject of meal service as applied to camps, and the quantities of meat, wheat products, and other commodities forming the daily bill of fare for the lumberjack.

The Need of Control Recognized

The need of having stringent regulations and oversight in connection with the food supply in woods operations was heartily endorsed by every member, and the lumbermen will do their part willingly and unitedly in the great conservation and economic campaign, which has been launched in pursuance of winning the war.

All matters were thoroughly discussed and several returns were brought down by lumber companies showing that on the major items, such as beef, pork, butter, sugar, etc., the expense of feeding the lumberjack per day or week is very much the same in all camps.

Different ways and means of arriving at the main object in view were entered into in detail, and the proposition of purchase, supply and distribution reviewed from every standpoint. It was the desire of all that united effort should be made to assist the government in every possible way by economy, efficiency, and uniformity.

The licensing system was endorsed and every endeavor will be made by the companies to work along the lines laid down by the powers that be after the final proposals have been approved.

The proposal to hold cooks and waiters as well as proprietors and managers of camps personally responsible, under heavy penalties, to see that no infringement of the injunctions are permitted was approved. Some discussion took place regarding the best and most economical means of serving food with the idea of eliminating waste and doing everything feasible in conserving wheat, beef, bacon and fats. The cafeteria plan was suggested, individual containers, and other means of apportioning the allotment of each man.

The intimation that substitutes for certain foods and the eating of dried fruits, preserves, jams, honey, maple, corn and cane syrups, cereals other than wheat products, eggs, fish, potatoes, vegetables, salads and soups, would materially assist in providing commodities such as wheat, beef, bacon and fats for export, met with a favorable verdict.

What the Ottawa Men Desire

The Ottawa River Lumbermen sent the Georgian Bay Lumbermen's Association a copy of the reply which had been forwarded to Mr. T. Byrom, of the Food Controller's office, Ottawa. It embodies several important suggestions, and is as follows:—

A very representative meeting of the lumbermen of the Ottawa Valley was held here on Thursday for the purpose of considering the proposed regulations for the feeding of men in lumber camps.

I am desired to convey to you, and the Controller, the strongly expressed and unanimous desire of the meeting to co-operate with your Board in the effort to conserve foodstuffs in every way possible.

It was the opinion of the meeting that, in the special circumstances that surround lumbering in this district, and taking into account the following considerations, viz.:—

1. The inaccessibility of most of the camps, situated as they are many miles from any railroad.
2. The necessity for many of the men carrying food with them to be consumed at a distance from the camps.
3. The peculiar exigencies of the "drive," during which operations are carried on from daylight to dark.
4. The illiteracy of a large proportion of the men. It would not be feasible to adopt either the cafeteria system, which is a success in some mining camps, or the observance of wheatless or meatless days.

Assuming that your object is to conserve certain foodstuffs, particularly wheat, pork, beef, sugar and butter, the meeting was unanimously of the opinion that this object would best be attained by a system of rationing, leaving it to each employer to devise methods to limit consumption to the prescribed ration.

Allowances for Ottawa District

The experience of the lumbermen prompts the suggestion of the following ration per man per day for this particular district:

Pork or Beef	1½ lbs.
Wheat Flour	1 lbs.
Lard (compound)	1/10 lbs.
Sugar	¼ lbs.
Butter	1/10 lbs.

Where possible, the meat ration should be divided as follows, viz.:

Beef	1 lb.
Pork	½ lb.

This division will not, however, be possible in all cases, and at all times, particularly on the "drive."

After January first next, when old "keep-overs" will have been consumed, and new "keep-overs" will be sent in, a modification of the ration will be possible, as substitutes can then be obtained. This is not feasible at the present time, in view of the inaccessibility of the camps in the summer season.

Referring to your circular B-3, dated March 22nd, 1918, the meeting suggests modifications, as above, but advises the retention of other regulations not inconsistent with such modification.

The avoidance of waste should be aimed at in every way possible, and the keeping of pigs at or near camp sites should be encouraged.

A licensing system, combined with a requirement of periodical sworn reports as to the number of meals served, and the consumption of foodstuffs during the period under review, together with frequent and rigid inspection of the camps, is a sine qua non of the successful administration of any regulations adopted.

A short, easily understood and clearly printed resume of the regulations (in English and French) should be supplied by your Board to the lumbermen, who should be required to post such notice in a prominent position in every camp.

I am directed to request that your Board permit a small delegation of lumbermen to wait upon you, and discuss this important matter, at such time as you may be ready to come to a decision thereon.

A meeting of the operators in the Georgian Bay District, where conditions in some localities may be somewhat different from those prevailing in the Ottawa Valley, is to be held in Toronto on the 16th instant, and a copy of this letter is being forwarded for consideration at that meeting. We feel, however, that the conditions under which we are compelled to operate should receive due consideration at your hands.

Chairman of Committee of Ottawa River Lumbermen.

Committee on Co-ordinating Interests

It was finally moved by Wm. Milne, and seconded by F. M. Gray, that we approve in general of the suggestions as outlined by the Canadian Food Board (in B-3 under date of April 11th, 1918), and that a committee of three be and are hereby appointed to consider

the details of the suggestions and to confer in conjunction with the Ottawa River lumbermen, with the Food Controller, with a view to co-ordinating all interests and further develop the suggestions as may be consistent.

This was carried unanimously and the committee named consisted of W. E. Bigwood, W. J. Bell and James Ludgate.

These gentlemen will act in connection with a committee of the Ottawa Valley lumbermen in interviewing the Food Controller with respect to the details covering the meal service in camps. It is understood that the members will also take up certain matters in connection with the shortage, distribution and control of labor.

Those Who Were at the Conference

There were present W. E. Bigwood, of Graves, Bigwood & Co., Toronto; A. J. Jordan, of Sudbury, secretary of the Georgian Bay Lumbermen's Association; George H. Holt, of the Holt Timber Company, Bolger Bridge, Ont.; W. J. Bell, Spanish River Lumber

Company, Sudbury; William Milne, of William Milne & Son, North Bay; W. J. Merkel and James Ludgate, Schroeder Mills and Timber Co., Pakesley; J. A. Ferguson, Spanish River Lumber Co., Massey; Thomas Clemow, Laforest and Clemow, Sudbury; A. E. Beck, C. Beck Mfg. Co., Penetanguishene; J. J. McFadden, McFadden and Mallory, Blind River; G. E. Spragge, and R. Jackson, Victoria Harbor Lumber Co.; George R. Gray, Spanish River Pulp and Paper Mills, Sault Ste. Marie; F. M. Gray, Standard Chemical, Iron and Lumber Co., Toronto; G. B. Nicholson, M.P., and J. McN. Austin, Austin and Nicholson, Chapleau; H. Mutchbacher, Holt Timber Co., and others.

The Ottawa Valley Lumbermen, who met the Georgian Bay representatives in the afternoon, were D. McLachlin, Arnprior; D. A. Gillies, Braeside; A. E. Dunlop, Pembroke; J. W. Smith, Pembroke; John Black (J. R. Booth), Ottawa; H. A. Jordan (M. J. O'Brien), Pembroke; P. C. Walker (Shepard & Morse), Ottawa.

Lumberjacks No Longer "Blow Their Stake"

How Home Instinct, Moral Standing and Sense of Citizenship Has Been Materially Improved by the Work of Shantymen's Christian Association

By William Henderson, Superintendent

William Henderson, Toronto.

Some twelve years ago I was surprised to learn that although Canada was spending much money in sending missionaries to distant heathen lands, there were many thousands of men in our own land who never had a visit from any missionary. On general principles this seemed so wrong that to get better acquainted with the fact I accepted a mission appointment for the winter in the Algonquin Park, and devoted all the spare time that looking after three churches allowed, to visiting the camps. The result of this first winter's experience was to convince him that a non-sectarian mission was the only true way to benefit these men. The Y. M. C. A. officials at that time having expressed an interest in the lumbermen I met the Provincial Committee in April, 1907, and urged

them to enter the field, suggesting they use the name "The Shantymen's Christian Association." Finding at the end of a year that nothing but talk had been done by these gentlemen, I decided to go ahead and form a committee of those most keenly interested, and if possible achieve something. Thus, in the spring of 1908 this work came into existence with a staff of one missionary.

Without the promise of a dollar and no means of letting the needs be known, the first year of work was a severe test of faith, as less than \$300 was received, and the traveling expenses were heavy. So little had been accomplished that we hesitated about printing an annual report, but concluded to do so, and issued it under the title of, "The Day of Small Things."

The problem of how best to reach the camps had been with me that year, so I issued an appeal for funds to build a special sleigh in which workers could sleep, and a team of horses to take us around. These were provided, and we were the next winter enabled to reach one hundred and thirty camps containing some seven thousand men.

From the first, we made it a rule to take up no collections in the camps, and the lumberjack's astonishment was great that we should take the trouble thus to visit them. One man exclaimed, "The end of the world must surely be coming when people spend all this money just to preach to lumberjacks."

That winter's trip enabled me to give very tangible evidence of the needs of these men, and from year to year since then the work has steadily grown. This past year has seen missionaries of our Association in the Canadian camps as far Northwest as Northern Saskatchewan, and as far east as the Laurentian Mountains in Quebec. They have also been in camps in Minnesota, Wisconsin and Michigan. In all they have ministered to over 30,000 men.

Everywhere they have carried Gospels, in the various languages spoken by the men in camps, for free distribution

This invasion of the United States has led to the recent organiza-

tion in Chicago of The Shantymen's Christian Association of the United States, to work in co-operation with the Canadian Association, and to secure this I have been appointed Superintendent, with an Assistant Superintendent in Wisconsin to direct work in the three States mentioned.

While the fact that individual prodigal sons have each winter been known to return home after years of wandering, may not be of general interest to business men, some other facts should be.

It is well known that ten years ago the Ontario lumberjack systematically "blew his stake" or being robbed when drunk was relieved of it.

Within three years of the organization of this work a decided change was noted in every district visited, and it was remarked that the men cashed their cheques and went home by the first teams available. When a year or so later petitions for prohibition were circulated in the camps nearly all the men signed them, and thus helped to make Ontario dry.

In Wisconsin are found to-day the same conditions as prevailed ten years ago in Ontario, and there must have been some cause to bring about the change referred to. We know of no other agency in the camps but the visits of our missionaries.

Again, in the lumber camps in the States the I. W. W. have made great trouble, and found a substantial following.

The Effect of Environment

In Ontario their literature has been scattered in the lumber camps, but not enough persons have been affected by it to cause any trouble, and what following they seem to have is among the non-English speaking. Here also the only difference in environment is the visits of the missionaries and their methods of approaching the men.

The I. W. W. know full well that the greatest obstacle to its success is the fundamental doctrines of the Christian religion and first of all, therefore, launch their attacks on them. The living exponents of these teachings, with their simple message, do more to hinder the spread of this peril to the community than could a regiment of soldiers.

The danger spots in Canada are not the lumber camps visited by missionaries, but those not reached by them yet, such as the mining and construction camps, where the claims of religion are ignored, and seven days work a week makes it hard for any missionary to get in touch with the men.

If we have a revolution in Northern Ontario the men responsible for it will be the proprietors who have worked their men seven days every week.

No general canvass of the employing lumbermen has ever been made for funds for this important work, but a few firms have been regular contributors from its inception.

The greatest economy has always been exercised in the administration and there have been no office expenses. The secretary-treasurer, R. D. Richardson, 103 St. Clair Avenue, Toronto, gives all his services free of charge. Surely every lumber firm, in their own interests, should assist financially the spread of this work.

During the last year 546 camps were visited; 668 services held; 30,232 men heard the voices of the missionaries, of whom 5,232 were French, 9,400 foreigners, and 15,600 English-speaking. The eighteen missionaries walked 3,448 miles in their visits to the camps.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Basswood Wanted

Highest cash price paid for log run basswood and mill culls. Also other hardwoods of all kinds. Address Box 712, Canada Lumberman, Toronto. 7-10

Cedar Shingles Wanted

Eastern Ontario Lumber Company would like to purchase from the manufacturer five to seven million 16-inch Cedar Shingles. Could handle satisfactory grades for successive years. Box 715, Canada Lumberman, Toronto. 8-9

WANTED

Spruce Squares and Lumber

Several cars Clear and No. 1 Eastern White Spruce Squares, any size, 4 x 4 to 6 x 6 or over, 4 ft. and longer; can be shipped green from saw. Also several cars 5/4 in. or 1 3/4 in. quarter sawn; also 5/4 in. Clear and No. 1, plain sawn, Spruce Squares and Lumber. Box 735, Canada Lumberman, Toronto, Ont. 9-12

Wanted-Basket Bottoms

Ten cars of Basket Bottoms in spruce, pine or other suitable soft woods in the following sizes:

16 3/4 in. x 6 7/8 in. x 7/16 in.

Minnesota Forest Fire Losses

The annual report of the Minnesota State Forestry Board submitted by C. C. Andrews as secretary of that board to the governor indicates that the fires in state forests during the year were large and that nearly 1,125,000 acres were burned over and that property valued at \$2,074,328 was destroyed. Prompt and efficient fire fighting, the report adds, prevented greater losses. The hazards were reported as the greatest since the establishment of the forestry service in 1911, and most as bad as those in 1910, when Baudette and Spooner were destroyed. The report also showed that \$10,000 of state funds were spent in fighting fires during the year and that in addition railroads, lumber and mining companies, together with towns, counties and settlers, contributed \$135,000.

Paper Company Gives up Spruce Logs

That the United States Government's efforts to secure spruce logs is materializing in some quarters was evidenced by the transfer of fully 1,000,000 feet of spruce logs from the Hawley Paper Company booms above Oregon City locks in the Willamette River to the mill boom of the Multnomah Box & Lumber Company at Portland, to cut for airplane stock primarily. These logs had been towed from the lower Columbia River to Portland, loaded at the hoist on the east side on to cars and hauled to Oregon City, and dumped in the boom preparatory to making paper, but on receiving request from the government, the Paper Company relinquished the logs which were then floated back to Portland, the tugs backed water to hold the rafts steady in the current and out of shoals and eddies.

Correspondence Solicited

WALTER HARLAND SMITH
Manager Horse Dept.

We offer the following dry stock for immediate shipment

1 car 3 in. Soft Elm, No. 1 C. & B.
1 car 1 in. Soft Elm, No. 1 C. & B.
1 car 1½ in. Birch, No. 1 C. & B.
1 car 2 in. Beech, No. 2 C. & B.
1 car 1 in. Beech, No. 2 C. & B.
1 car 1 in. Soft Maple, No. 2 C. & B.
1 car 1 x 4 Birch, No. 2 & 3 Com.
1 car Cedar Posts, 8 & 9 ft., 5 in. & up

Will be pleased to quote prices.

PEDWELL HARDWOOD LUMBER CO.

79 Spadina Ave - TORONTO

Review of Current Trade Conditions

Ontario

There has not been any radical change in the general situation in Ontario during the past two weeks. Transportation is steadily improving, and the carrying companies have come to the rescue in some cases with commendable enterprise. The opening of navigation will ease the situation so far as local shipments are concerned. Quotations are still stiff, and some wholesalers are hanging back, not caring just yet to take up the output of certain mills, particularly in soft woods, as they feel to do so at present prices is too much of a gamble. Others do not think that stocks at the figure now asked by some mills are worth while holding, as the amount involved is too large and the future too speculative. While there is no indication that prices will drop, still when they do fall the majority of members of the trade think it will not be a decline of one or two dollars a thousand, but everything will come down with a bang. The policy of most wholesalers at the present time is one of caution and conservatism. Ordinarily speaking, they are not afraid to take a chance, but just now the rather discouraging news at the front and other uncertain elements which have been injected in the situation, such as the shortage of labor, the new Military Service Act, registration of the man power of the country, etc., all tend to unsettle business. Labor is very scarce at the present time, and while a number of mills had begun sawing and others will begin at the middle of the month, conditions may work out better than expected, although the wage question is one that is becoming very trying. Stocks of hardwoods are very limited, and whatever lines are in hand are commanding particularly good prices. There is a good demand from furniture manufacturers, piano firms, graph-anola companies, and others, which keeps business up to the mark. Dry softwood stocks are not large with the mills, comparatively speaking, and retailers are not buying to any large extent at the present time. They are holding back owing to the lull in building operations. In several cities plans are under way to erect large numbers of workmen's houses, and, if these materialize, it is believed that considerable impetus will be given to the trade. No wood is being exported, and a representative of one leading Canadian company who returned recently from Washington states that the export trade is practically killed. The difficulty and delay of obtaining licenses, permits, and other routine proceedings that have to be gone through, and even then not being assured of bottoms to carry the stock, renders all effort in this direction largely of a negative character.

The recent awarding of shell box contracts will call for large supplies of spruce, pine, birch, beech, elm, and maple, and create a lively demand for these woods. Were it not for munition work and government contracts the lumber business as a whole would be rather stagnant. One leading authority made the statement the other day that in normal times about 75 per cent. of the lumber used went into buildings, repairs, and alterations, and the remaining 25 per cent. in other lines. To-day he says this condition of affairs has been reversed, and 75 per cent. of what is moving goes into government work. This is the one thing which keeps business fairly active. The new freight rates are now into effect, and British Columbia representatives report that the charge per hundred from Vancouver to Toronto is 71.7 cents, where the former rate was 67. This, along with the shorter hours in the camps and mills, has caused an advance in British Columbia stocks which have not been coming through in very large quantities of late, owing to the tie-up on the railways, particularly in the West.

Eastern Canada

The car situation has improved considerably, and shipments are going through to Ontario and other points with much greater facility than they are across the line. There is but little prospect of the foreign trade being improved at the present time, as the carrying of foodstuffs, munitions, and other supplies needed at the front displaces all other commodities, which are practically classed as non-essentials. The labor situation is none too reassuring, and mills are finding it increasingly difficult to get sufficient men. Wages have advanced a good deal, and the Military Service Act will take some of the younger men away. Not a few plants have lost from five to twenty men under the new military draft. Values in most lines are strengthening, and one wonders how high prices are bound to ascend. Some manufacturers hope that the limit has been reached, as they fear that the reaction may set in. Building operations have been greatly curtailed, and fully 60 per cent. of the wood that is now sold is used for government purposes, such as munitions, aeroplanes, shipbuilding, etc. Recent

advices from Boston say that a fair demand exists for lumber, but that the delivery problem is still handicapping trade. Conditions seem to be improved, but from this out it is hoped that there will be little or no trouble in filling orders. Lumber is beginning to come into Boston from the South and West, after long months of practically total embargo. Just what effect it will have on prices cannot be foretold. The market is fairly strong at present, particularly on the lower grades, and some authorities think that the way matters are being lined up that the top has been reached. As the season advances there is a little more tendency to sell. Cedar shingles are pretty firm, but there are not many coming in from the Pacific Coast, which leaves rather a serious shortage in the Eastern market, although the demand is small. The awarding of contracts for some 750,000 two-round 6 in. shell boxes will naturally create a much livelier demand for lumber in various lines. It is understood that further orders are to be awarded for 4.5 boxes. On the whole, there is not much change in the general situation, but there may be some definite developments before the end of the spring season. Manufacturing costs are climbing all the time, and operations in all lines will be more restricted than last season, owing to shortage of timber taken out and scarcity of mill help.

United States

The large lumber enterprises, as well as the smaller concerns in the United States, are doing their part in carrying along and subscribing to the third Liberty Loan. The members of the trade in all its branches recognize that patriotism and production go hand in hand, and when the fate of democracy hangs in the balance, if an extra push or spurt is needed to "go over the top," the lumbermen would be found there with the other great allied business interests of the great republic. Possibly the chief feature of the week is the demand for hardwoods of all kinds. All available supplies of birch and basswood are picked up very quickly, and mills in this line report that there is a large requisition in Canada. The dealers in the Dominion are scouring the United States for supplies of white ash, birch, and basswood, but the one difficulty in the way is the securing of an export license. A number of buyers from the other side are also visiting the Dominion, seeking such hardwoods as Uncle Sam is short of. The demand from furniture factories has picked up considerably. One the whole, the sellers who are doing a good business are supplying the government requirements, either directly or indirectly. Many mills that formerly catered to private trade are now looking after government interests. They find the latter a very good customer. The number of box cars available has improved considerably, and transportation is better than it has been for some months. Prices are firm in all lines of hardwood, and, on the average stiffer, than they were last month. In spite of this, the number of producers say that the costs of the manufacturing has increased more than the figure for the finished article. From general reports, the market for Southern pine is livelier than it has been for months past. The chief difficulty is the lack of labor. It is said that in some places help is so short that when the loading of cars is speeded up men must be taken from the sawmills, and this, in turn, causes a falling off in production. The trend of prices seems upward, and a recent price index made by the "American Lumberman," compiled from average prices paid for twenty grades of yard stock, shows that the figure is now \$29.87, as compared with \$29.70 two weeks ago. The normal production is estimated at 93,622,862 feet weekly.

The prices which the government has set for spruce appear to be generous, and the figure to be paid in the New England section has been federally fixed up to July 1. The Washington authorities will require a good deal of spruce, as it is understood the plan is to use this kind of wood wherever possible in government buildings. This action will stimulate imports of spruce from Canada. On the Pacific Coast spruce producers recently received a government order for 500,000 feet of common lumber, which shows that an attempt is being made to move the side lumber resulting from the cutting of airplane stock.

In hemlock there has been rather a united effort to get hold of stock, and Eastern mills are declining some business, as they state that civilian needs cannot be ministered to until government orders have received full attention. A considerable volume of hemlock is called for by retailers, but, on the whole, country buying has been rather quiet. In Douglas fir, if the producers were in a position to take all the private business that is presenting itself, some records would be broken. Fir is now sold in what is ordinarily known as Southern pine

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

territory, and thus its area has been considerably enlarged. Prices are firm.

Great Britain

The volume of trade in hardwoods and mahogany is extremely limited. The small and varied parcels of lumber that now from time to time come forward have assisted business somewhat, and a good proportion of the trade that is moving consists of dealings in these goods. The imports during the last couple of weeks have been fairly satisfactory, but it is said most of the goods were brought forward under permits for government work, and that the amount of stock otherwise shipped was relatively small in comparison.

The new schedule of prices for home-grown timber shows that the authorities are anxious to encourage output, and it is needless to say that the changes made will prove to be a good stimulant to greater supplies, says the "Timber Trades Journal," but besides the hitherto continued complaints as to poor remuneration, the shortage of labor has been keenly felt, and the trickling of men from the camps to the army has caused the home timber merchants and others engaged in the trade to despair of keeping up with the work they are called upon

to do. These, however, will be pleased to see from the army order that the authorities are taking precautions to keep as many men as possible for work in our woodlands. The demands that will be made on our timber resources during the next twelve months will be enormous, but special inducements have been given the trade to make a larger output. The position is much clearer with regard to calling up men for the army, so that it only requires greater railway facilities to keep the traffic moving briskly.

Reports from Liverpool indicate that the position with regard to American hardwoods is about the same as it has been for some time. The arrivals of parcels of hardwoods during the past week were up to the usual quantities coming forward; and, while the volume of trading is nothing like what could be desired, yet the tendency to keep trade moving is increasing in proportion to the stocks coming to hand. There is a good demand for oak, satin walnut, and poplar, and these kinds of timber remain in active request. Unfortunately, all grades of stock have now become very low, and, although a few parcels are being yarded, yet the paucity all round is very marked. However, more shipments are expected, and no doubt before long a change for the better will set in.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Buying in Ottawa Falls Off Slightly

A slight decrease in demand, coupled with a considerable improvement in transportation facilities, were the two principal features of the Ottawa lumber market during the past month. The decline in orders, while it was not by any means of a serious nature, caused some speculation, but did not affect prices.

The market remained firm, there being no change in quotations as compared with late March quotations. Higher prices seem likely. Stocks usually low at this period of the year were reported in some quarters to be below those carried during a corresponding period a year or two ago. The market was not overstocked.

The improvement in transportation and embargoes provided the brightest outlook. An increased amount of rolling stock was available and the embargoes applying at United States points were lifted considerably, at destinations other than sea ports. Generally, the situation, considering these two phases, was considerably easier than it has been for months. Conditions did not actually revert to normal, but steadily climbed toward it. The opening of navigation on the Ottawa River, Rideau Canal, St. Lawrence, and United States canals, it was firmly believed by Ottawa lumbermen, would further tend to greatly improve the transportation situation. Congestion at American terminal points appeared to be decreasing.

The shortage of dry stock was chiefly noticeable in grades of pine and spruce. The volume of domestic business showed some improvement over March. The foreign demand appeared to have slackened somewhat.

Whether the demand for export to the United States is to permanently fall off or the decrease is only brought about by ordinary conditions of a temporary nature, is pretty much of a guess. It seems beyond conception that the United States has received or ordered all the lumber it requires from Canada. It may be that United States buyers are holding off placing orders in an effort to definitely find out what the manufacturers are going to charge for their 1918 mill cut. Again shipments have been going through regularly for the past two or three weeks, and it may be that sufficient supplies have arrived for immediate needs. In all probability with the increasing war effort by the American Government it is very likely that as much, if not more, lumber will be required in the future than has been shipped across the border since the United States entered the war.

Prospects of the market weakening or prices going lower are practically nil. Yards are not overstocked, and the manufacturers have not shown any too keen an interest to dispose of their holdings until they know just how much labor is going to be available for the sawmill operations. The absence of sufficient help to operate the sawmills may tend to send the prices sky high, disregarding the amount of increased wages the manufacturer has to pay his help.

Most of the sawmills in the Ottawa district opened up during the last ten days of April. It was too early to state definitely what conditions prevail. The operators of sawmills, big and small, are doubtful if sufficient labor will be available to operate the plants fully from the start. In the case of the John R. Booth sawmill it began operations on a limited scale, and trusted that when word of the mill

being in operation became noised about that former employees would gradually return to it.

Sufficient logs were in the Ottawa River below Deschene Rapids to ensure the operation of the mills for some weeks.

Other logs by the tens of thousands were in "reserves" on the Upper Ottawa between Deschene and Chats Falls, and could be quickly moved as soon as the ice began to move down river. The operation of the amended Military Service Act will also likely tend toward a further decrease in the available supply of mill labor. The unsuccessful tendering by Ottawa woodworking plants for further shell box orders was expected to result in swelling the supply of labor available for the sawmills.

Coal cars continued to be used freely for shipping lath and rough lumber.

Conditions for export to the English or European market showed no activity or change.

General conditions, excepting the improvement in the transportation situation, showed little or no change with Shepard and Morse, as compared with early April. Mr. P. C. Walker reported orders continuing fairly good. Embargoes were easier. The Shepard and Morse sawmill opened on April 23rd.

The Davidson sawmill at Fort Cologne opened during the latter part of April. Labor was not plentiful. At the beginning Mr. Grant Davidson stated he expected sixty to seventy dollars per month with board would have to be paid for sawmill labor.

Jackson Booth stated that sales from the manufacturing standpoint are fair, with manufacturers not overly anxious to quote prices for the 1918 sawing. Mr. Booth's sawmill, while it has started, will not likely fully operate until some time in May. The supply of labor available for the operation of the sawmills this season, Mr. Booth thought, would have a considerable bearing on prices for this year's cut.

Mr. Belford, of Gilmour and Company, stated orders are continuing good for dry stock and the prices of 8-inch spruce boards showing an advance of \$2 per thousand, and are selling freely at \$45 per thousand for dry stock. Dry stocks were reported getting scarce. An improvement in the transportation and embargo situation is noted. The opening of navigation will assist this company in forwarding both domestic and foreign shipments.

Montreal Says Outlook is Fair

Although the volume of local business in Montreal is much about the same as at last writing, more orders are coming in from provincial centres. Building reports indicate that there is an increase in the amount of construction, in schools and churches, besides some important industrial plants. In one or two places, such as Shawinigan Falls, there is considerable activity, due to business arising out of the war. Two of the largest buildings are the acetic acid plant under construction at Shawinigan Falls for the United States Government, and the ferro-silicon plant at Beupre.

Trade with the United States is still good, but the car situation, although a little better, leaves much to be desired. Orders for dimension timber are slow.

The market all round is very firm, the outlook being for still

The Only Milk You Need in the Camp

Klim supplies all milk needs for Lumber Camps—and saves money, transportation charges, storage room and labor.

Klim is pasteurized, separated milk in powder form. It is made by separating the butter fat from pure Ontario milk and reducing the remaining body-building food value, casein, albumen, milk sugar and salts of milk to powder form by removing the 87½ per cent. water content of the original milk.

When dissolved in water according to directions, it makes a liquid with the natural milk taste.

Klim is a Wartime Economy.

Klim is economical. It costs less per gallon than any other form of milk. It bulks small—weighs light—saves 50 per cent. to 75 per cent. of freight bills on your milk supply. It keeps sweet and fresh until all used. There is no spoiling and wasting through changes in temperature.

In a word—Klim is pure, wholesome, convenient and economical. Use it and save money.

It is "the regular milk" used daily in the Lumber Camps of Canada. Your cooks probably know Klim. Add it to your list of supplies.

EASTERN BRANCH—306-308 Wellington Street, Ottawa, Ont.

higher prices. Wholesalers state that manufacturers have not departed to any appreciable extent from the waiting attitude they took up, and are by no means anxious to sell the new cut except at stiff figures.

Some recent shell box orders given out in Montreal are reported to have been let at low prices, although one firm states that the latest contract obtained was at higher quotations than was previously secured. Probably the Imperial Munitions Board will have to pay still stiffer rates for the next lot of boxes, as apart from the increase in the price of lumber, there are indications that some manufacturers are waking up to the absurdity of tendering at values which are below cost. This has been due to the scramble for orders, and to the ignorance of certain makers as to their costs, caused by a failure to accurately estimate the exact charges which enter into the making of the goods. The result of this reckless competition is seen in the elimination of many firms, who have paid the price of unbusinesslike methods, and have also kept down prices to a basis which is, generally speaking, unremunerative. The Imperial Munitions Board naturally accept the lowest prices offered, and are not responsible for a condition created by the manufacturers themselves. Exporters of lumber and timber will have to pay increased harbor charges on any goods shipped, which will amount to very little unless conditions radically change. On lumber and timber the wharfage charge is increased from 8 to 10 cents per 1,000 feet b.m., or \$1.50 per carload when handled by rail. On railway ties, the charge is 25c per 100 pieces of 8 feet lengths and 50c per 100 pieces of 16 feet lengths. Pulp board and wood pulp are raised from 6c to 8c per ton, and newsprint from 12c to 15c per ton. On cars switched by the Harbour Commissioners' railway the charge has been increased by 50c. The increases are due to higher costs for material, service, and labor, coal being a large item in the expenses. Lumber landed on the wharves ex barge or steamer is to be allowed a further delay of three days for removal in addition to the four days generally allowed to goods. If the lumber is not removed after the seven days, additional wharfage charges will be made.

Imports of newsprint into the United States from Canada increased about 5,000 tons during February, as compared with the corresponding period last year, the total being 38,428 tons; while the imports of wood pulp from Canada show a considerable falling off, being 7,861 tons as against 12,815 tons in February, 1917.

St. John Men Up Against Heavy Costs

From the manufacturers' standpoint, the conditions at St. John have not improved to any extent during the past two weeks. No buyers have been found who are paying prices which are consistent with the advance in the cost of logging over a year ago. The price of manufacturing has also arisen with leaps and bounds, labor and materials used in sawing are advancing from day to day, and the logs being smaller are causing the mills a reduction in the saw bill, besides which the man power is less efficient. All these matters are coming up before the mill man and if he cannot get his asking price he must either stop manufacturing or sell without a profit unless he is willing to pile his sawn lumber in his yards or on his wharves and hope for better rates. This is in reality what the St. John mills are doing, and is a condition they have never faced in years. Bank logs are coming forward and are bringing around \$20 per thousand, an advance of \$5 to \$6 per thousand over a year ago for logs much inferior to last year's logs.

The figures being offered by the American buyers only leave about 25 cents on the cars for random stock. This, it can be seen at a glance, is not profitable, as the costs of sawing are much higher—in fact, the mill man would lose at these quotations. It is to be hoped that the American Government will set a profitable figure, and as they have been in committee at Washington during the past week along with the representative lumbermen from the East, perhaps before this gets into print the prices will have been adjusted to the satisfaction of all concerned.

The St. John River ran out from Grand Falls to Seven Islands on the 17th and from Grand Falls to St. John on the 20th. The booms at Fredericton are now closed and logs are being received. At the time of writing no driving has started and conditions do not look very prosperous as the snow is fast going and with cold nights and days the water is dropping. Unless rain comes driving must be much delayed, and delays are dangerous and expensive as crews must be held and paid. Driving wages are from \$3.50 to \$4.00 per day, which is about \$1.00 per day higher than ever, and men are very scarce.

Locally conditions are better, and rail shipping is easier, as cars are more plentiful. Building continues very inactive, and no improvement under present conditions can be looked forward to. The lath market is very dull, not over \$3.00 being paid for cuts of the mills for 1918. Shingles are also very draggy. Factory business is reported to be only fair. While the factories are busy, they are not manned to capacity and are only turning out about half the volume of business they could do on account of shortage of help.

Lumbermen's Protest Gets Attention

Canadian Railways Will Not be Allowed to Charge 15 Per Cent. Increase on All United States Hauls

The "Canada Lumberman" understands that at the meeting of the executive of the Canadian Lumbermen's Association, held in Ottawa on April 23 and 24, the matter of discrimination against Canadian shippers by the railways was discussed.

The details of this question, which are referred to in the report of the last regular meeting of the Wholesale Lumber Dealers' Association, Toronto, appearing in this issue, were explained to the directors of the C.L.A. by Mr. A. E. Clark, of Toronto, chairman of the Wholesale Lumber Dealers' Association. It was suggested by him that as representatives of the trade were present from various parts of the Dominion, the matter should be brought to the attention of the Railway Commission. Mr. Clark stated that the 15 per cent. increase, which recently went into effect on Canadian roads, was being charged by the transportation companies on the United States portion of a through haul. This was in a number of instances a discrimination against Canadian lumbermen, especially as the Interstate Commerce Commission had ruled that the increase on lumber rates across the border was not to exceed one cent per hundred pounds.

With the Canadian roads charging 15 per cent. increase, Canadian shippers were seriously handicapped, as the advance in some cases would run as much as 4 and 4½ cents per hundred pounds on the American haul, instead of the maximum of 1 cent per hundred pounds, as ordered by the Interstate Commerce Commission.

Sir Henry Drayton, chairman of the Dominion Railway Board, was communicated with and announced that he would receive a deputation from the Canadian Lumbermen's Association and the Wholesale Lumber Dealers' Association. The members met the chairman of the board, and the facts of the case were laid before him, the speaker being Mr. A. E. Clark, chairman of the W.L.D.A.

Sir Henry announced, after hearing the full particulars, that, in his opinion, the railroads were not dealing justly by the lumber interests, and the 15 per cent. tariff would be suspended in the matter of the United States portion of the journey.

The provisions of the bankruptcy bill which has been introduced in the House of Commons by Mr. S. W. Jacobs, M.P., were approved. An outline of the measure has already appeared in the "Canada Lumberman," and it is felt that the industry in all its branches, along with other lines of commercial activity, would profit by the enactment of the uniform legislation proposed. The executive went on record as being thoroughly in favor of the bankruptcy bill.

Another matter of interest discussed was the employment of alien labor and a resolution of the Employers' Association of Hamilton to the Federal Government was endorsed. This memorial is to the effect that all neutral and alien labor should be regulated, and, inasmuch as laborers of this class are being furnished with work, they should be compelled to perform a full day's labor, six days each week. It appears from the lumbering standpoint that many of these men have been earning such a high wage during the past few months that the tendency is to put in fewer days in the week. This interferes with the uniform output of mills as compared with pre-war standards. The general opinion of the members seems to be that alien laborers, now being able to earn as much in half the time as they formerly did when compelled to keep at it steadily, are inclined to lay off too much.

The question of housing men in lumber camps, as suggested by Mr. Fitzpatrick, of the Reading Camp Association, Toronto, was not given any serious consideration, the members believing that the plan proposed is too costly, radical, and impracticable.

The proposed rationing regulations for men in camps as outlined by the Canada Food Board, was given much consideration, and the opinion was expressed by some that the cafeteria system might work out to advantage. It is felt that conferences with the Food Controller, which have been going on for some time, will result in a satisfactory arrangement of the feeding of the men and in the conservation of wheat, meat, sugar, fats, etc. The cafeteria plan has been tried in a number of mining camps, but whether it would prove a more efficient and economical way of catering to the lumberjacks than the methods which have prevailed in the past remains to be seen.

A committee, consisting of A. H. Campbell, R. G. Cameron, and W. E. Bigwood, was appointed to confer with the Executive Committee of the Wholesale Lumber Dealers' Association, Toronto, with reference to the extension of the Bureau of Information, to include the lumbermen in the eastern part of the Dominion. It is probable that if the details now under consideration work out satisfactorily, offices may be established in Ottawa and Montreal.

Those present at the gathering were W. G. Power, president of the Canadian Lumbermen's Association; Daniel McLachlin, Arnprior; Gordon C. Edwards, Ottawa; A. E. Clark, Toronto; G. W. Grier, Montreal; W. T. Mason, Montreal; A. H. Campbell, Montreal; Angus McLean, Bathurst, and W. M. Ross, Ottawa.

Work of the Forestry Corps

Capt. Schuster, Lumberman, of Belleville, Back in Civilian Ranks after Efficient Overseas Service

Capt. W. E. Schuster, of the Schuster Company, Limited, wholesale and retail lumber dealers, of Belleville, Ont., after two years overseas' service, as transportation officer on the headquarters staff of the Canadian Forestry Corps, is once more in civilian life. Capt. Schuster has had an interesting and eventful career in that he was connected with the first unit authorized for timber operations in Great Britain and the allied nations. When he arrived in England he was assigned to the post of officer in charge of transports in the city of London. The various forestry units were later brigaded and Capt. Schuster was appointed to take charge of technical equipment and transportation. Later he took the title of Railway Traffic Officer, personally directing the movement of vast stores in equipment on the British railways and the Atlantic transports as it related to the Canadian Forestry Corps. The work of Capt. Schuster was characterized by faithfulness, efficiency and devotion to duty.

"Yes," he declared recently, "I went overseas with the original unit which was authorized on March 1st, 1916, and on May 13th following we had actually made a delivery of timber and lumber to

Capt. W. E. Schuster, of Belleville receiving a welcome home.

the War Office. The lumber and timber was cut by the men of this unit at Virginia Water near Windsor Park and sawmills and technical equipment all came from Canada. I do not think it necessary for me to make any extended reference to the work of the Canadian Forestry Corps as what they have done in England and France has attracted world-wide attention. I consider it a great honor to have been associated with the pioneer unit, the 224th Battalion, and believe when the history of the Forestry Corps comes to be written in all its details after the war is over, it will be shown what great and useful work the boys accomplished."

Capt. Schuster is an old Belleville boy who has resided all his life in that city. After being educated at the public and high schools, he entered the service of the Rathbun Company, with whom he spent several years. On the latter closing out their interests in Belleville, the business was continued by the Schuster Company, who have built up a large trade. They specialize in rough and dressed lumber, shingles, sash, doors, and hardwood flooring, and also handle Portland cement and hard and soft coal. Mr. Walter N. Belair is Capt. Schuster's right-hand man and partner in the business.

In regard to the delivery of lumber, Capt. Schuster says that all prices are quoted at the yard, and there is added to the same the actual cost of delivery. In respect to the distance from the yards and the size of the load persons therefore pay proportionately. The Schuster Company are not manufacturers or contractors, but have a well-equipped yard which possesses both rail and water communication. They have also ample sheds for storing dressed lumber.

"No," concluded Capt. Schuster, "we do not prepare plans or specifications; we leave matters of this kind to the local contractors. We think that belongs to their special line of business and we confine ourselves exclusively to the matter of supplying materials."

Ellwood Wilson, chief forester of the Laurentide Company, Limited, Grand'Mere, Que., is on an extended trip to California and other points west and south.

Increase in Rafting Rates on the St. John

The bill relating to the application of the St. John River Log Driving Company to increase its rates for rafting and booming logs was before the Corporations Committee of the House of Assembly at Fredericton, N.B., recently. A conference between representatives of the company and the lumbermen was held following the committee meeting and it was reported that an agreement was reached upon certain matters in dispute.

The proposition of the company was that on account of the heavy increase in the cost of rafting and the marked decrease in the quantity of logs handled at its booms an increase should be made in the rates. It is proposed that the company shall create an operating fund each year in advance of the drives, the amount to be estimated from the charges for rafting and booming, and adjustment to be made after the logs have been counted. The sum of \$15,000 was first suggested but later it was reduced to \$12,000, that being the figure which is not to be exceeded. This fund is to be raised by an assessment. Operators who may not take part in the formation of the fund, by paying in advance on fifteen per cent. of their cut may have the logs which get into the booms of the company by accident, handled by the company. Other operators who may not take advantage of either arrangement are to pay \$2.50 per thousand extra on their logs handled in the company's booms.

Mill Costs Go Up With Shorter Hours

The B. C. Loggers' Association recently conceded their men an eight-hour day at ten-hour wage rate. In order to hold their crews intact the millmen in turn felt compelled to grant a shorter day despite a recent wage advance, and they are now operating their plants on a nine-hour basis for five days of the week, with half-time on Saturday. Some of them are paying the ten-hour rate, while others are paying their men by the hour, with extra pay for any overtime work. As a result of this serious jump in operating costs, taken in conjunction with the advance in log prices carried into effect in February, and the impending increase in railway freight rates, the manufacturers have had to mark up the selling price of a number of items. Meetings of the Association were held, when the following increases per 1,000 feet were decided upon: Timbers, \$4, with spread ranging from \$1.00 on 41 to 45 feet lengths up to \$33 on long lengths; No. 2 car sills (up to 34 feet), \$5; No. 3 car sills (up to 34 feet), \$10; select common fir (rough), \$4; fir tank stock (rough), \$5; 1 x 6 in. car roofing, 1 x 4 in. and 1 x 6 in. car sheathing and lining, \$2; car decking, \$4; 1 x 3 in. and 1 x 4 in. car flooring, \$5; boat decking, 3 x 3 in., 3 x 4 in., also fractional and odd sizes, \$5; cross-arms, \$4; steel frame box car lining, \$4; ties, 6 x 8.8, \$4; switch ties, same as rough lumber.

The shingle market shows considerable strength. This is due to the increased cost of production caused by most mills giving a nine-hour day, with same pay as formerly was paid for ten hours' work. Production so far this year has been somewhat smaller than in 1917, owing to weather conditions that have made it impossible to get sufficient bolts out of the woods to keep bolt mills cutting, and several mills that cut logs have been down part time—due to being unable to get cars in which to make shipments.

The new freight rates which have just become effective to all points on the Prairies and Eastern Canada will have the effect of advancing delivered prices to dealers. From the above it will be seen that consumers cannot expect to obtain their supply at the prices that have previously prevailed. The following are present trade quotations, f.o.b. mill: XXX, \$2.90 to \$3.00; XXXXX, \$3.60 to \$3.65; Eurekas, \$3.90; Perfections, \$4.25; 6/2 XX, \$1.90 to \$2.00.

Logging operators report no particular difficulty in securing labor for their camps—especially since the eight-hour day was introduced. Log prices remain at: No. 1 fir, \$20; No. 2, \$15; No. 3, \$11; shingle cedar, \$15 to \$18; lumber cedar, \$18 to \$20; hemlock, \$12 to \$15; spruce, open.

The numerous different uses to which wood from a single Douglas fir log may be put was illustrated by a cross-section of such a log displayed recently in the West. Every portion of this log was marked with its own particular use. A list of these uses follows: Lath stock, finish, flooring, stringer, ship decking, airplane stock, ship plank, joist, tie, structural timber, bridge timber, stepping, clear cant, dimension, ship ceiling, broom handle, milling stock, running board and post.

The firm of Irvin & Sellers, hardwood merchants, of Liverpool, Eng., has been converted into a limited liability company, under the style of Irvin & Sellers, Ltd. There will be no change in the management or policy of the business. William B. Irvin is managing director of the new company, and has associated with him several well-known persons as members of the directorate.

Jeffrey Square Shank Pin

"Hercules" Combination Malleable Iron and Steel Chain

Here are Some Advantages of the Jeffrey Square Shank Pin Construction:

The hard, smooth steel pins with the SQUARE SHANKS fit into perfectly SQUARE HOLES. The bearing surface is the FULL WIDTH of the pin. There is no rocking motion in the side bar.

The solid cast link is made of high-grade malleable iron, both for strength and durability. The long barrel provides extra wearing surface on the pin and the sprocket wheel.

Steel Side Bars are of high carbon steel—and interchangeable.

The Square Shank Pins are made as rivet or coupling pins.

Jeffrey Square Shank "Hercules" Chain is a most economical and substantial chain for service in handling gritty materials and for heavy duty Elevators and Conveyers.

"Hercules" Chains may be used over standard detachable chain sprocket wheels as follows:—

102-B on	95-J	132 on	122
111	on 108	188 on	88
131	on 103		

We are the originators of this type of Chain, and have been building and improving it for 25 years. Write for our Chain Catalog, No. 211-6.

The Jeffrey Manufacturing Co.

Canadian Branch and Warerooms - MONTREAL

Lumberman Passes the Century Mark

Colon LaFortune, lumberman, of Norfolk County, recently celebrated his hundredth birthday anniversary at the home of his daughter, Mrs. Ed. Nicholls, of Port Dover, Ont.

All of his surviving children—one son, Frank, of Simcoe, and four daughters, all resident in Norfolk, were present. The venerable centenarian followed lumbering on Big Creek from Tillsonburg to Port Royal in the early days. He is erect, active, and hearty, and enjoys his daily pastime, angling.

Many of his fifteen grandchildren and twenty-one great-grandchildren called on him. The family are noted for longevity. A sister died at 98, a brother at 103, and three other brothers lived over 92 years. Colon LaFortune has been a total abstainer all his days.

Newsy Briefs from Ottawa

Lieut. Kieth Davidson is to return to France on May 15th. His furlough has been shortened.

Building operations will likely run well over a million dollars in Ottawa this year.

Lieut.-Col. James Vincent Patrick O'Donahoe, commanding the 87th Grenadier Guard, Montreal, has been reported wounded in action in France.

Agricultural machinery, farm produce, and wagons to the value of thirty thousand dollars was recently destroyed by fire at the John R. Booth farm on the Merivale Road.

The steamer "Bronson," one of the finest tow boats of the Upper Ottawa Improvement Commission's fleet, and valued at \$100,000, was recently destroyed by fire at Pembroke.

Mr. and Mrs. Robert M. Cox celebrated their fiftieth anniversary of marriage on April 16th. For the past forty years Mr. Cox has spent a considerable portion of his time at Ottawa attending to his lumbering interests. Mr. Cox is eighty-one years of age. His wife is five years younger. There are thirteen grandchildren.

In connection with the proposed increase of from twenty-five to fifty per cent. in fire insurance premiums on woodworking and other plants as proposed by the Canadian Fire Underwriters' Association, the view of Mr. Jackson Booth is that a sliding scale system, allowing for discounts, will be put in force. His opinion is that a general rate will be struck, but if a mill has certain fire prevention appliances, and the buildings are in good shape and of modern construction, that dis-

counts from the general rate will be allowed. Munition plants will likely be hardest hit by the proposed increase. Since the beginning of the war, many plants have had to extend their buildings, and in some cases the additions were not up to the standard of the previously insured structure.

B. C. Woods for Technical School

A carload of British Columbia spruce and fir arrived in Toronto recently as a gift from the British Columbia Lumber Association to the Toronto Central Technical School. The timber, which is of the finest quality, is valued at \$1,000, and is to be used for experimental purposes by the pupils of the Technical School. The Advisory Industrial Committee of the Board of Education recorded a hearty vote of thanks to the lumbermen of the far West for their generous gift.

Personal Paragraphs of Interest

Second Lieut. Maurice F. Peiler, R.F.C., is reported missing. He is the son of Mr. H. L. Peiler, manager of the Mason Regulator and Engineering Company, Limited, Montreal, Que. A later message states that he is a prisoner in Germany.

Patterson & Tilley, of Hamilton, Ont., has been changed in style to Patterson & Crosthwaite. Mr. Harvey Crosthwaite, who for a number of years has been associated with Mr. Patterson, has been taken into partnership. Mr. Patterson returned lately from a holiday trip to the south.

The many friends of John Donogh, manager of the Dargan Lumber Company, Toronto, are sorry to learn of his serious illness. At the last meeting of the Wholesale Lumber Dealers' Association a resolution of sympathy was passed and many flowers have been sent to the bedside of Mr. Donogh.

Lieut. J. A. Gordon, son of Alex. C. Gordon, of Mickle, Dymont & Company, Toronto, was killed in action in France on April 4. He secured his commission through the 12th York Rangers, and assisted in raising the 127th Battalion doing recruiting work at several points. He then assisted in raising the 220th Battalion, going to England with them. When this corps was broken up he took further instructions and finally was attached to the 4th Battalion in France, serving many months in the trenches and escaping injury until he was killed. He was 26 years old.

EDGINGS

Ontario

J. E. Butler & Son, Vittoria, Ont., lumber dealers, recently suffered a loss by fire.

Rankin & Co., 1536 Dundas Street West, Toronto, Ont., recently lost their planing mill by fire.

W. H. Hutchinson, Goderich, Ont., is contemplating the erection of a ship-building plant, to cost \$25,000.

The Mattagami Lumber and Sawmills Company, Timmins, Ont., have assigned to Hector E. Montgomery.

Croucher Brothers, of Craigielea, Ont., have installed extra machinery in their sawmill and erected an addition to their buildings.

D. H. Gillies Company, 288 Adelaide Street, London, Ont., whose sawmill was recently destroyed by fire, will commence rebuilding as soon as the insurance is adjusted.

The Keewatin Lumber Company started a night shift in their big mill at Kenora recently. It is the intention of the company to run the night shift throughout the season.

The sawmill of W. J. Brown, Warkworth, Ont., was recently destroyed by fire. The mill had been operating during the day, and it is thought the blaze, which broke out at night, may have started from the engine room.

J. Stirrett & Sons, Port Arthur, Ont., who are erecting a modern sawmill, will do all their own work. The lumber, machinery, and equipment have all been purchased. The building is of frame construction and the capacity of the plant about 30,000 feet per day.

The Elbow Lake Lumber Company, whose mill at Elbow Lake, Ont., operated for a short time last fall, expect to start sawing again about the middle of May. The mill has a capacity of 40,000 feet a day, and the company have sufficient logs to cut two and a half million feet during the coming season, principally white and red pine.

The Shevlin-Clarke sawmill at Fort Frances, Ont., recently started the season's operations. The plant has sufficient logs to keep running all summer. There are at present in the employ of the company about 700 men and a number of others in the woods. The mill has a capacity of about 600,000 square feet a day, and the payroll is over \$60,000 a month.

John McMartin, M.P., of Cornwall, Ont., who recently passed away, was president of the Labrador Pulp and Lumber Company. He began his career working for two years in a lumber camp and later went railroading. He was largely interested in mining operations, being one of the first to start in the Porcupine and Cobalt district. He was 59 years of age.

The Dargan Lumber Company, Ltd., has been incorporated, with head office at Toronto, Ont., and capital stock of \$40,000, to purchase and deal in standing timber, timber limits, and to carry on business as shipowners, timber merchants, timber growers, sawmillers, pulp and paper millers, etc. The provisional directors are J. L. Ross, A. R. Holmsted, and L. B. Campbell.

The sawmill and store of the Moulthrop Lumber Company at John Island, Georgian Bay, were burned to the ground recently. It is understood there was no insurance. No lumber was lost. The mill had a capacity of about 20,000 feet a day, and had been in operation for a number of years. G. H. Moulthrop, of Bay City, Mich., is at the head of the company which owned the mill.

The Monteith Pulp and Timber Company, who operate a mill on the Driftwood River at Monteith, Ont., will saw about four million feet of spruce this year. Last year their cut was two and a quarter million feet. The company handled in 1917 about thirty-five thousand cords of pulp wood along the T. and N. O. and the Transcontinental lines, for shipment to various points, but this year have bought only twenty-five thousand cords, owing to the difficulty experienced in getting cars.

Eastern Canada

Pauze & Gohier, Montreal, P.Q., lumber dealers, have dissolved.

Roberge & Rosseau, lumbermen, Laurierville, P.Q., have dissolved.

Wilfrid H. Pauze, lumberman, Montreal, P.Q., has been registered.

The Eagle Lumber Company, Ltd., have moved from 97 to 90 St. James Street, Montreal.

Blair & Rolland, Ltd., have removed from the Coristine Building to the McGill Building, McGill Street, Montreal.

The Audet Sawmill, Black Lake, near Sherbrooke, P.Q., will rebuild their sawmill, and will be in the market for machinery.

The Montreal office of the Canadian General Lumber Company, Ltd., has been removed to 203 McGill Building, McGill Street.

The Council for Scientific and Industrial Research will carry out at McGill University, Montreal, investigations for the development of a commercial process for the production of high-grade domestic fuel from sawdust.

Fire recently destroyed the sawmill of Luc Martin, Ste. Anne Des Monts, P.Q. A quantity of wood was also destroyed. The loss is estimated at \$8,000. The company will rebuild in a few months, and will spend \$8,000 on the mill.

The Laurentide Company, Grand'Mere, P.Q., recently lost their sawmill by fire. Mr. George Cahoon, Jr., is the manager and Mr. W. Small is the superintendent. The loss is estimated at \$20,000. The company will rebuild immediately.

The Consumers' Cordage Company, Ltd., Montreal, are distributing to buyers of cordage some very neat calendars, starting April 1, 1918, to April 1, 1919. Any cordage user can obtain one by writing to their head office, Montreal, or branches.

Anselme Dube, Limitee, has been incorporated, with head office at Three Rivers, P.Q., and capital stock of \$49,900, to carry on the business, among other things, of manufacturing and producing lumber, timber, pulpwood, wood pulp, paper, doors, and to operate lumber mills, workshops, saw and shingle mills, planing and grooving mills, rossing mills, etc. Among those interested

are M. M. Anselme, U. Dube, N. Dube, and P. A. Heroux, all of Three Rivers, P.Q.

The Lumber Supply Company, Ltd., has been incorporated, with head office at Montreal, P.Q., and capital stock of \$50,000, to carry on business as manufacturers of and dealers in lumber, timber, etc. Among those interested are A. Lachance, W. Picard, and D. Raymond.

La Compagnie & Bois Bedard, Limitée, has been incorporated, with head office at Joliette, P.Q., and capital stock of \$50,000, to carry on business as pulp and paper mill operators, and to manufacture and deal in lumber, wood, shingles, woodenware, wood pulp, etc. Among those interested are J. H. Sansregret, J. O. Malo, J. W. Boulet, and O. Bedard.

The Taylor Engineering Company, of Vancouver, has been awarded the contract, at a figure of over \$750,000, for the construction of a floating dry-dock which will be built in the vicinity of Vancouver. The dock will be identical in design with one which was built a few years ago by the Interisland Steam Navigation Company of Honolulu. The structure will be capable of completely docking vessels of 4,500 tons, but repairs will be carried out on vessels of a tonnage of 12,000.

The St. Maurice Paper Company, Three Rivers, Que., and Donnacona Paper Company, Donnacona, Que., are following the lead of other pulp and paper companies in building houses for their workmen. The St. Maurice Company's cottages will have concrete foundations, will be of frame construction, lighted with electric light, and with British Columbia fir trim. The cottages of the Donnacona company will be of two storeys and a basement, stucco construction. The roofing will be of shingle, and the floors of birch, pine, or spruce.

A deputation from St. Remi d'Amherst, P.Q., has asked the Montreal Chambre de Commerce to support a scheme for extending, for ten miles, the railway line now terminating at Porcelain Mine, in order to serve the cantons of Boileau, Suffolk, and Addington. It was urged that the extension would give access to districts capable of furnishing large stocks of pulp wood and lumber; that it would serve the lumber limits of the Riordon and Edwards Companies, and that 3,000,000 feet could be transported each year. Six saw-mills are now operating in the district.

Compagnie des Placages (Veneers) Canadiens, Ltd., has been formed, with a capital of \$150,000, to deal in timber limits and to carry on the business of lumbermen, saw and planing mill owners, manufacturers of and dealers in veneers, and to manufacture veneers by a secret process so as to make it waterproof, to make veneer boxes such as are used for rubber and tea, and to manufacture waterproof veneers for the building of aeroplanes and hydro-planes. Mr. J. A. Vincent, manufacturer, and Mr. A. Phaneuf, accountant, Acton Vale, P.Q., are interested. The principal place of business will be in Montreal.

In an address delivered recently in Montreal by H. D. Bean, purchasing agent of the Abitibi Power and Paper Company, he stated that 2,000 tons of newsprint paper was the daily demand from the United States on Canadian mills, and that it required 250 tons of newsprint every 24 hours to furnish Canadian journals with the supply required. Nearly \$160,000,000 was the amount invested in the 100 pulp and paper mills in the Dominion, and it took the pulp wood from approximately 60,000 acres to supply the demand of Canada alone for a year. Mr. Bean believed that Canada had 350,000 square miles of pulp wood limits, and 60,000 acres taken out would not make a noticeable inroad.

Western Canada

The Shearwater Lumber Company, of Clayburn, B.C., have added a re-saw to their mill, which has a capacity of about 35,000 feet a day.

Stanley Irwin, formerly district forester, with headquarters in Prince Rupert, is now in the lumbering business for himself. He is operating at present on the Queen Charlotte Islands.

At a recent flood on the Clearwater River, Alberta, all the sawlogs boomed along the stream were swept away, and the Bryan sawmill was under water to such an extent that only the smokestack was visible.

A sawmill is cutting ties at Kakawa Lake now, and the sawmill erected at Jessica, a short distance up the line on the Kettle Valley Railroad, is also in operation. A Rosedale shingle firm is also getting out bolts at the mouth of the Coquahalla, on property owned by interests in Victoria, B.C.

The first consignment of rived spruce for airplane construction arrived in Vancouver from the Queen Charlotte Islands recently by the steamer Prince Albert, which brought a cargo of 15,000 feet. This inaugurated the shipments from special spruce camps working for the Imperial Munitions Board.

Some idea of the new business which is developing in Prince Rupert is shown by the fact that the Grand Trunk Pacific has just contracted for hauling 4,000 cars of spruce lumber this year across the continent, and it is estimated that other shipments of lumber and fish from Alaska arising from new business will require many more trains.

Sealed tenders are being received by the Minister of Lands for British Columbia until May 14, 1918, for the purchase of License X95, to cut 1,217,000 feet of fir, tamarac, yellow pine, and spruce, and 14,000 fir and tamarac ties on Lot 6245, Sand Creek, near Jaffray, Kootenay District. Two years will be allowed for the removal of the timber.

A recent despatch from Vancouver says that contracts for 22 ships similar to those now under construction at the various shipyards of the province will be let within the near future by the Imperial Government, through representatives in Canada, providing the builders will be content with a smaller profit. If British Columbia builders cannot take on the orders and be content with less profit these orders will, in all probability, be placed in the United States.

A recent despatch from Prince Rupert says that the effect of prohibition is strikingly illustrated in the logging camps of the Queen Charlotte Islands, where there is at present a very cosmopolitan population. The workers include, outside of Anglo-Saxons, Afghans, Sikhs, Turks, Japanese, Chinese, Indians, Russians, South Americans, Germans, and Austrians. The authorities report that the men all get along together very well, comparatively few cases of disorder arising.

Captain Robert Dollar, head of the Dollar line of steamships and owner of a big sawmill at Vancouver, which cuts principally for the company's yards in China, was the speaker at a luncheon given by the foreign trade section of Vancouver Board of Trade last month. The veteran shipowner and lumberman gave an enlightening talk on the subject of foreign trade. The time was not far distant, Captain Dollar declared, when the centre of the world's commerce would shift from the Atlantic to the Pacific.

Head Office: 910 NEW BIRKS BUILDING, MONTREAL, P.Q.

Branch Office: 568 MANNING AVE., TORONTO

No. 2½. Actual Size

Cutting Remarks!

About Tested Teeth

The saw tooth illustrated is the best made for mills cutting heavy steam feeds. This No. 2½ Chisel tooth saw is made in suitable gauges for Edgers, Bolters and Lath Machines.

Better not trust to luck with your lumber sawing—"Hoe" the genuine saw is safe and certain. We know because every one is tested before leaving the "Hoe" factories.

A hundred years experience has taught us how to produce saws that prove durable and trustworthy under the most strenuous working conditions.

Our interesting illustrated catalogue should be in the hands of every Canadian Lumberman. By giving better service, "Hoe" Saws, Bits and Shanks save you money.

R. HOE & CO.

504-520 Grand Street
NEW YORK CITY

Absolutely

The merit of a product is attested by the demand.
The volume of demand is evidenced by the size of the works.
And when the works, steadily increasing, year after year
attain immense proportions—

THEN is conclusively demonstrated the continued and
absolute confidence of a vast army of users in the
excellence, worth and reliability of the goods.

Logging the Year Round

By the means of modern Logging Machinery for skidding the Logs from the stump to the track Logging operations may proceed the year round, regardless of ground conditions. Logs may be skidded across bogs, swamps, ravines, etc.; may be brought up out of bad depressions or "pockets"; may be carried over small streams; up or down hill, over or around obstructions or obstacles of any kind. And all this may be done without the expense of building roads, and without the delay of waiting for the ground to dry up or freeze up so you can get on it.

Lumber is needed, and urgently needed, in many ways for the prosecution of the war. Therefore, lose not the precious summer months, but cut and ship every working day in the year.

We make the machinery to enable you to Log the Year Round. Our Booklet, "Suggestions for the Lumberman," tells how this machinery is used.

LET US HEAR FROM YOU IF INTERESTED.

GOODHUE BELTING

For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

"Little David" Wood-borer at work
in a Canadian shipyard

To Speed Up Production In Wooden Shipbuilding Use

"LITTLE DAVID" LABOR-SAVING DEVICES

Why?

Because—"Little David" tools are strong; crank-shafts and connecting rods, steel forgings, oil-treated; pistons of steel, hardened and ground.

"Little David" tools have interchangeable parts, have no screwed joints to cause annoyance, and have all working parts enclosed in dust-proof, grease-packed chambers.

"Little David" tools will stand a tremendous overload.

"Little David" tools are light, economical, and have one third less parts than other air-tools of the same capacity.

Shall we send you Bulletin 8507?

BELT STANDARDIZATION

Power transmission needs fall into comparatively few classes. For each one there is a Graton & Knight Standardized Belt. That means a belt which is scientifically built for exactly the class of duty to be performed. It is kept uniform. It pays us to make it standard for quality, because it pays mill-owners to make it standard for use.

Write for complete information about Standardization as applied to Belting.

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention !

We have the ONLY device that removes ALL danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, breakdowns or dislocation of parts—IT WORKS ALWAYS. Though still new, it is thoroughly tried and tested, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you TEN times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you CAN use them with this equipment; you need it on your cars right now, and you will WANT it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

Many Fires in Lumber Mills have been caused by Hot Boxes

This risk can be eliminated by the use of
Chapman Double Ball Bearings

— IN —

Shafting, Hangers, Pillow Blocks
Loose Pulleys, etc.

Chapman Double Ball Bearings

decreases the friction loss 75% and do not generate heat.

No oil is used, a little Tranco Grease once or twice a year is the only lubricant required, consequently dust does not adhere to the outside of the bearing.

There is no spoilage from oil drip, and cleanliness may be easily maintained.

If you realized what these savings mean you will agree that

**You pay for Chapman bearings
whether you buy them or not**

**Chapman Double Ball Bearing
Co., Ltd.**

347 Sorauren Avenue - Toronto, Ont.
705 Shaughnessy Bldg. - Montreal, Que.

Transmission Ball Bearing Co., Inc.
1050 Military Road, Buffalo, N.Y.

American Barking Drums are principally of angle construction. They are of first class workmanship and material throughout. Made in diameters from 6 ft. to 14 ft. Made in lengths varying from 15 ft. to 30 ft. Designs are frequently altered to meet the exacting or peculiar conditions of the purchaser.

16 Reasons

why the

American Barking Drum

is so rapidly revolutionizing
barking methods

1. **CONTINUOUS PROCESS.** The wood is fed into the drum automatically at one end and it comes out **BARKED** at the other end.
 2. **LABOR SAVED.** One man can handle a drum alone and bark from 25 to 100 cords per day, depending upon the wood.
 3. **WOOD SAVED.** The drum removes the **BARK ONLY**. The good wood remains intact.
 4. **CLEAN WOOD.** The spray at the outlet end cleans the barked wood nicely.
 5. **SOLID WOOD.** Our drums are so built and operated that bruising and brushing are reduced to the absolute minimum.
 6. **CAPACITY INCREASED.** One drum will do the work of 8 or 10 men and it will work day and night without going on a strike or without demanding higher wages.
 7. **WET OR DRY.** Each method has its advantages and an American Barking Drum will work either way.
 8. **ANY KIND OF WOOD.** Whether hemlock, spruce, poplar, pine or other species, knotty, smooth, large or small, long or short, up to 5 ft. lengths, makes no difference.
 9. **BARK IS USABLE.** Run the bark through a press or allow it to dry and use it for fuel.
 10. **SPACE SAVED.** Our drum requires much less space than any other barking machine or method.
 11. **LOW COST.** Compared with other machines the cost of our drum is low.
 12. **LOW MAINTENANCE.** Users advise us that upkeep costs are nominal.
 13. **POSITIVE DRIVE.** This is an important design feature that you should know about.
 14. **BEARINGS HIGH AND DRY.** Easily kept in order, lubricated, out of the wet and dirt.
 15. **NO GEARS OR TRUNNIONS.** A study of barking drums and methods will convince you of the superiority of our design throughout.
 16. **SAVES WATER.** Very little water is required to operate. The bark carries away the principal waste, which is unavoidable.
- In addition to this, it should be remembered that our trade mark slogan is "SERVICE FIRST." We not only build the **FOREMOST** drum, but we give the **ONLY REAL SERVICE**.
- If you have much wood to bark you should immediately get in touch with our engineers who will gladly advise you without obligating you in any way.

WHY

Bond Hangers

Eliminate

Hot Bearings

Are you considering the purchase of Hangers for your new factory?

Perhaps you do not realize the necessity of buying hangers that will eliminate hot bearings, or the trouble they will cause in a hanger? If a bearing happened to become hot in a hanger holding six or more machines, and they all stand idle while the shop mechanic fools around trying to fix it, you'd soon realize what inefficiency and expense this is.

The Ring-oiling device on Bond Hangers supplies a constant flow of lubricant on the full surface of the shaft and bearings, which keeps them cool when running at high speed.

Get our catalog containing full details before you buy.

Rubber Goods FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "P.M.S.," "Special Drive" and "Lion" are our leading brands for power transmission.

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable.

Hose for Steam, Water, etc., in various grades, made especially to give satisfactory and economical service under different conditions.

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion.

Basic Facts About Belting

AND PARTICULARLY

Dunlop "Gibraltar RedSpecial" Frictioned-Surface Transmission Belting

A Worthy Product

Years of careful study of the high-power belt problem have enabled Dunlop Laboratory experts to create "Gibraltar RedSpecial" Belting, the

original Red Face Rubber Belting of Canada—a product worthy of the Dunlop Factories and of the quarter-century record of success back of them.

"Gibraltar RedSpecial" Virtues Are Real

Dunlop "Gibraltar RedSpecial" Belting is to-day widely used in a multitude of ways in the many varied industries in this country. It owes its success, not to any illogical deductions or fantastic analyses, but to the simplest causes—causes so

simple that they are now, always have been, and always will be, in our opinion, the bedrock of success in belt-making—Power, Speed, Service—in actual use as well as in the test-room.

Permanent Elasticity Means "Life" in Belting

In producing this new, this original, this master, red belt, our object has been to have the friction coat of rubber between the plies such as will retain its life indefinitely, and to have a quality of rubber

with long "fingers," and not a quality of rubber the elasticity of which has been sacrificed to obtain the so-called high-pulling test.

That "Friction Pull"

When you are informed that such-and-such a belt has a "friction-pull" of abnormal poundage, do not imagine that you are getting a quality friction. What you have to secure in a belt is a friction full

of elasticity. There must be between the plies of duck only a certain class of rubber to give uniform strength and pliability.

Resilient Quality Must Not Be Sacrificed To Excess of Friction Strength

To obtain high figures, such as referred to above, in belt frictions you have to take away from the elasticity of the friction: hence, there is a happy medium, and this medium we have obtained through our laboratory experts. It ensures for

you a belt, the friction of which will hold the plies together and will be sufficiently elastic in its properties to allow for the give and take necessary in rounding the pulleys.

Duck Finest Obtainable, Made to Highest Specifications

A highly important feature of "Gibraltar RedSpecial" is the duck which enters into its construction. Only the finest quality of specially-selected duck, having the proper tensile strength in the right direction, is used. And this, in combination with a superior rubber friction between the plies, ensures absolute uniformity of service.

Fills The Bill

"Gibraltar RedSpecial" Belting is to be found in practically every industry in Canada, and if it is Power, Speed and Service that you want, then it is "Gibraltar RedSpecial" Frictioned-Surface Belting that you require for your work.

Universal Recognition of "Gibraltar RedSpecial"

To cite the names of users of this famous, red frictioned-surface belt would necessitate the use of much space. We have on file recommendations from almost every type of industry requiring "Gibraltar RedSpecial" Belting in widths varying from 1½" to 48." These testimonials are available for your perusal at any time.

The Original "Red"

"Gibraltar RedSpecial," as noted previously, is the Original Red Rubber Belt—and like most things that are original, its success is of the kind that endures.

*The Babbitt Metal that's at the Front in Efficiency
and Economy*

HARRIS HEAVY PRESSURE

THE ARISTOCRAT OF BABBITT METALS**SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well. So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours
JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS****THE CANADA METAL COMPANY, Limited****Head Office and Factory TORONTO Fraser Avenue****Branch Factories—****HAMILTON****MONTREAL****WINNIPEG****VANCOUVER**

Turn Wood Waste Into Chemicals

Lumber Production and By-products

A Profitable Industry For Lumbermen

Send us your
enquiries,—
we will give
you our best
services by
return.

—make big profits from the Waste Wood lying around your mill by installing Wood Distilling and other Chemical Equipment. But be sure of MAXIMUM production by selecting plant with a GUARANTEE and REPUTATION behind it. We have specialized in process chemical plants for over 75 years, and have a world-wide experience. Our equipment ensures the ECONOMICAL and COMMERCIAL SUCCESSFUL using of waste woods in the manufacture of wood-pulp, distilling of alcohol, etc.

No. 3 LATH MACHINE

Our No. 3 Lath Machine is very strong in construction, both in frame and bearings, and will stand the grind of big production and continuous use. It is designed primarily for mills that require an enormous output—that must have speed and reliability. The success of a single installation has, in a great number of cases, been the means of our placing repeat orders in many parts of the Dominion. Floor space required, 4 feet by 4 feet 6 inches; weight, 1,600 pounds. Maximum power required, 15 h.p.

We also make equipment and machinery of all kinds for the lumber industry. Send for catalogue and list of machinery in stock ready to ship immediately.

The E. Long Manufacturing Co., Limited
ORILLIA, ONTARIO

Sawmill Machinery

The Waterous Twin Circular Saw

in conjunction with the Kendall Circular Gang presents the cheapest way of turning small logs into merchantable lumber. Four men only are required to operate it.

It takes logs up to 16 ft. in length and will cut cants from 4 inches to 12 inches in thickness.

THE TWIN CIRCULAR consists of two independently driven saw frames, carried on planed iron slides upon which they are adjustable, to permit cutting a cant as narrow as 4 inches or to a width of 12 inches.

FRAME CASTING is in one piece with the bearing cast solid with the frame to make mandrel alignment a certainty. The saw frames are adjustable by rack and pinion and controlled by a hand wheel making for rapidity of movement with a minimum of effort and no possibility of a shift during cutting.

SAWS are 42" in diameter and run at 700 R.P.M.

MANDRELS measure 3, 7/16 inches diameter and carry a 20" x 13" pulley.

BRANTFORD, ONTARIO, CANADA

"FROST KING" METAL

Our thirty-five years' experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal, made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 35c per lb., Fort William and East; West of Fort William, 40c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 75c per lb.; West of Fort William, 80c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

\$5,000,000.00

**worth of mixed metal

"WE AIM TO SERVE YOU WITH THE BEST"

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

*Send for catalogues of any or all of these machines.***Dunbar Engine & Foundry Co.**

Saw Mill Machinery FOR SALE

The following machinery is in good condition and is the balance of the Wm. Peter Estate Saw Mill at Parry Sound.
Write for quotations on any or all of this equipment.

- 1 Wicks Oscillating Gang Saw, 20-inch stroke, 37 saws wide, made by Wm. Hamilton Co., Peterboro, complete with live rolls, front and rear, spare set of Brasses for both ends of Pitman rod, 1 spare oscillating side, and 1 spare slide.
 - 1 right hand Allis Band Mill, single cut, 9 ft. wheels, Waterous Co.
 - 1 left hand single cut Allis Band, 9 ft. wheels, Waterous Co.
 - 1 right hand 3-Block Carriage, 40 inch, fitted with Payette set works, friction receder, 5 trucks, frame of carriage oak; never been used, except set works, which have been refitted; carriage built by E. Long Mfg. Co., Orillia.
 - 1 Steam Feed, 10 inch dia., 36 ft. long, vertical valves; never been used since being installed.
 - 2 Pneumatic Air Bumpers, 16 x 24; never been used.
 - Track and Flat (new).
 - 1 Steam Nigger, Waterous Co.
 - 1 Steam Loader, Waterous Co.
 - 1 Steam Kicker, with shaft and arms.
 - 1 right hand Champion Edger (Waterous Co.), 48 inches, 3 stationary saws, 2 movable saws.
 - 1 left hand Hamilton Edger, 54 inch, 4 stationary saws, 1 movable saw.
 - 1 Engine, 14 x 20 slide valve, Payette fly-wheel, 5 ft. diameter, 30 in. face.
 - 1 Engine, 11 x 18, slide valve, Inglis & Hunter fly-wheel, 6 ft. diameter, 16 in. face.
 - 1 Patterson & Berryman Water Heater.
 - Gordon Hollow Blast Grates, installed under 6 boilers, with blower located in mill; blue prints and instructions on hand.
 - 1 Geared Friction Log Haul, and chain about 300 feet.
 - 1 Ewart's Detachable Chain.
 - Special Heavy Forged Chain, about 800 feet.
- We have also on hand Live Rolls Drives, Pulley, Gears, Shafting, in addition to Filing Equipment, etc.

"The
Invariable
Choice of The
Man Who Knows"

HOW MUCH DO YOU SALVAGE FROM YOUR KERF PILE?

Q This is a question to be answered by the individual millman. If he cannot give a favorable answer, then he owes it to himself to investigate. The "341" is a leader in its class due to its superior construction and ability to take an overload and stand up under it. The feature most prominent on the "341" is its Straining Device. This combined with the thin gauge saw used is a sure means of reducing kerf. With this machine you can reduce that kerf pile to a minimum. The "341" shown above is installed in an institution where efficiency must reign. You are welcome to any information we have on the "341." Simply ask for it on a post card. It will be sent free and without any obligation on your part.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Square Dealing Needed to Solve Trade Troubles

During the past two years or more there has been more than the usual amount of uncertainty about the delivery of stock that has been ordered by retailers from wholesalers. Undoubtedly the reason in some cases for the failure of the wholesaler to make delivery has been the trouble caused by railroad embargoes, but there are some retailers whom it would be hard to persuade today that this excuse can be properly used in their own particular cases.

Each individual case of this sort has its own peculiarities and must be judged entirely on its own merits. It is best, however, in all such cases to look at the matter from an independent point of view if possible. What takes place in the retailer's office when a wholesaler takes an order? What the retailer thinks has taken place is that the wholesaler, on the strength of his knowledge of the market and ownership of stock, has represented to the retailer his ability to deliver stock for which he takes an order. Certainly, the retailer does not look upon the wholesaler to whom he gives an order as representing a firm who will deliver the stock "if they can." The retailer knows what his trade requires, and when he gives an order for it he naturally concludes that the matter is settled and that within a reasonable space of time the stock will be delivered. When it is not delivered, or when a great length of time elapses before delivery, the retailer's business affairs are disturbed and his own customers, who are wanting the stock, grow to look upon him as a dealer who cannot be counted upon.

What does the wholesaler think when he accepts the order? If he is a square-minded wholesaler, as fortunately the great majority of them are, he feels that he has committed himself to deliver the stock ordered, at the prices agreed upon. Naturally he believes that he is going to be able to make the delivery or he would not accept the order. So far, the understanding between the two parties is clear. At this point, however, a divergence of views sometimes de-

velops when the wholesaler finds it difficult to make the delivery, because of railroad conditions over which he has had no control.

What becomes of the responsibility of the wholesaler to make delivery under such conditions? Is he relieved entirely of the responsibility if he finds that the stock which he was counting upon to fill the order cannot be delivered? A hard and fast rule cannot be drawn up to govern all such conditions. For instance, there are cases where the stock is of such a class that only one source of supply is available, and it cannot be secured, because the railroads will not deliver it. The transaction, under such conditions, cannot be completed and the matter should be considered one for adjustment on a fair basis between the wholesaler and the retailer, possibly by the substitution of stock of another description, allowance being made by the wholesaler for the loss which his inability to make shipment may have brought upon the retailer. The desire of the wholesaler for the retailer's future trade will generally incline him to be as generous as possible in such cases.

There is generally an understanding between the wholesaler and the retailer printed upon the face of the correspondence relating to the order, that it is accepted subject to strikes, railroad troubles, etc., over which he has no control. Whatever the legal significance of this understanding may be, it should be given consideration by the retailer. The governing fact, however, in the great majority of cases, ought to be the urgency of the retailer's need for the stock, not forgetting, at the same time, the fact that most of the wholesalers are anxious to do their best for the dealers who give them their trade.

There are two very distinct situations which develop out of this kind of trouble. There is the case in which the wholesaler wants to deliver the stock, and there is the case in which he does not want to make delivery. Retailers ought to be as reasonable as possible in the former case and not endeavor to make the wholesaler live up to the letter of the contract if it is going to involve him in a heavy loss, especially if he finds that by making other arrangements he can satisfy his own customers.

In the case of a wholesaler who finds that a rising market is involving him in a loss against which he had not protected himself by purchasing early enough, and who then seeks to get out of the contract, and to lay the blame upon the railroad companies, a retailer is generally justified in taking a strong course, both for his own protection and for the sake of teaching the wholesaler that contracts are made to be lived up to whenever possible. There are not a great many of these cases, even today, when one would expect to come across them oftener than in normal times. There are just enough of them, however, to make the question a serious one and to make it advisable for dealers to look very carefully into all the conditions relating to a particular case before adopting a definite line of conduct in connection with it. Retailers, moreover, should remember that sometimes the shoe is on the other foot, as wholesalers can cite numerous cases of orders cancelled by retailers, on a falling market. The whole problem is one for fair dealing and calls for mutual concessions more frequently than for rigid insistence upon one's rights.

Charging for Delivery or Not—That's the Question

One of the live questions now being considered by various retail yard men is the matter of charging for the delivery of lumber. In years gone by, when labor, the upkeep of horses and wagons, and gasoline for motor trucks were not nearly as heavy as they are to-day, little attention was paid to the expense of maintaining and giving such a service. Since the outbreak of the war, however, normal conditions have been completely upset and the wages of men employed in yards increased all the way from 50 to 100 per cent., owing to the high cost of living. It seems, therefore, but fair and reasonable that retail lumbermen should receive an extra fee for providing facilities for delivery.

To estimate the outlay for such work in overhead charges and add this percentage to the price of the stock would perhaps answer the purpose just as well if such a method would operate equitably so far as all customers are concerned, but this can scarcely be worked

out uniformly, as many farmers, contractors and others send for, or rather take away their supplies, while private builders, owners of dwellings and those requiring a few thousand feet of material for repair or alteration purposes, have no such facilities. By all economic considerations, where a purchaser takes away the lumber, he should receive the lot below regular quotations if no levy is made for delivery. Of course, if the extra fee prevails, then the buyer hauling his own stuff secures it cheaper than the one who has to hand over a small sum for getting the merchandise to his door. In the smaller towns and cities, the problem of delivery is not nearly as expensive and perplexing as it is in the larger centres, where long distances have to be travelled. Some particularly nervy requests are made at times, in that even a few boards or shingles should be sent a couple of miles or more. On such trivial transactions the profit of the retail lumber dealer is more than wiped out by his outlay for delivery.

Any service to be fully appreciated must be paid for. That which is bestowed gratis is frequently abused and stretched to the limit of unreasonableness. Customers buying a few hundred feet of lumber will often not take the trouble to ascertain the exact quantities that they want and, with the utmost complacency, will telephone for extra stuff to be sent up, two or three times, especially where there is no charge made for hauling. If a fixed tariff was executed on each one horse, or two horse load, according to the number of miles covered, on something the same principle as a charge is made by a taxi cab—although, of course, at one tithe of the latter's excessiveness—such persons would be more careful and relations between retailer, and customer would be on a sounder and better basis. Perhaps a zone system might be agreed upon.

It may be urged by the opponents of charging for delivery that coal and wood men deliver their wares free to all customers, no matter in what portion of the city the latter may reside, but there is this to be said in favor of the fuel merchant that, if a patron provides his own conveyance for taking away his allotment he is allowed a substantial rebate below the figure that prevails where delivery has to be made. It is not on record that any patrons of retail lumber yards who provide the means of removing their product are allowed any discount, and just here is where discrimination comes in.

Placing Canadian Shippers Under Handicap is Frustrated

It was stated some time ago that the railways were possibly the most incessant source of trouble which the lumber interests have had to face during the past few months, and more particularly when embargoes, car congestion, licensing regulations and other exactions on the part of the carrying companies nearly caused the movement of lumber to come to a complete standstill. Now that the car situation has improved another phase looms up. The first that presented itself was the desire of railways to restrict the dressing-in-transit service and increase their stop-off charges. This has been so vigorously opposed by the lumber interests that the proposed limitation of the facilities has been abandoned and it is probable that doubling of the rates will not go into effect. In view of the fifteen per cent. increase which the companies were recently allowed by the Dominion Railway Board, the fact that Canadian lines tried to "put one over," to use a colloquial expression, on the lumber manufacturers, and especially those who make large shipments to the United States, was, from a strategic point of view, clever enough to come under the head of military manoeuvres. They sought to steal a march on shippers. The executive of the Wholesale Lumber Dealers' Association and the C. L. A. are composed of live-wire men who soon discovered this smooth piece of effrontery on the part of the carrying concerns when they essayed to charge fifteen per cent. on the United States portion of a through journey.

Here is where the Aethopian was lurking in the wood pile. The decision of the Interstate Commerce Commission was to the effect that American roads could not increase their maximum rate for hauling lumber in excess of one cent per hundred pounds, yet Canadian lines were proceeding serenely to levy fifteen per cent. increase which, on

certain routes across the border, would run as high as four and five cents per hundred advance. Canadian lumbermen were thus being discriminated against and in their exports placed at a decided disadvantage when coming in competition with those south of the border.

This is but another example of the avariciousness of Canadian railways, who were going to make money on the United States portion of through hauls and that at the expense of Canadian lumber interests, who pay the transportation organizations hundreds of thousands of dollars annually in freight rates. The situation would be laughable in the extreme, were it not for the serious character which it assumed in a financial sense. That Canadian companies thought that they could violate the State laws of the neighboring Republic and get away with higher rates than the American lines, shows that frequently a bold move is often a successful one. The procedure would possibly have gone on for some time in the present instance, had not the Wholesale Lumber Dealers' Association and the Canadian Lumbermen's Association promptly called the attention of the Dominion Board of Railway Commissioners to a gross transgression of the rights of shippers, with the result that this traffic travesty is likely to be adjusted at the earliest possible moment.

The Housing Problem and Its Industrial Relations

The housing problem is becoming more acute in its complex relations and is now being given most serious consideration not only in various civic centres but also by federal governments. It is a recognized fact that men will not remain in any community where they are not comfortably and properly housed. The opportunities today are too numerous and transportation too easy for labor to stay in any one spot under discouraging circumstances and amid undesirable surroundings.

The efficiency of men is largely contributed through the health and the happiness of their home life, and governments are recognizing this more today than ever before. An extensive housing scheme is being undertaken by the United States Government which is appropriating millions for building model homes, to accommodate the workers of the shipbuilding and other war industries. Conditions change with the progress of the times, new experiences make for larger and loftier opportunities and what would have been regarded as a socialistic move a few years ago is now looked upon as a thoroughly rational and democratic one. Canadian town planning is now being undertaken by different municipalities, and all big industrial firms lay out a model town site when locating in new places.

Evidence of progress is furnished in the newer type of buildings which are being erected for workmen who now have the comforts and conveniences which a few years ago only the rich could afford. It seems to be an economic and natural law that the best and most proficient workers will abide where the most attractive housing and social facilities are to be had. The United States Government has voted an appropriation of \$50,000,000 for the building of houses in connection with new shipbuilding industries, and another measure provides for a grant of \$60,000,000 to the Secretary of Labor for housing work in connection with war industries other than shipbuilding. The spending of this money comes under two separate housing boards, one to be responsible for the shipbuilding programme and the other for the general industrial programme. It appears these Housing Boards lend up to 80 per cent. of the money required in different places on a 4½ per cent. interest and control the character of the housing enterprises through the experts of the association. One of the reasons the government is doing this work is that private undertakings in regard to building are practically at a standstill in the United States, as they are in all belligerent countries. The causes are that capital is being mostly absorbed by the government for war purposes, while the costs of materials and labor have advanced so much that most contractors are diffident about proceeding, believing that they will never be able to reap a sufficient return in the shape of rents to repay them for their outlay. The cost of dwellings to be built now will be from 15 to 20 per cent. above what their value will be after the war.

What An Association Does for Its Members

How Southern Pine Manufacturers Are Kept in Constant Touch With Output, Prices, Shipments, Demand and Costs—An Active Publicity Campaign

By C. W. Wilkinson. Union Lumber Co., Toronto

Believing thoroughly in organization and the effective work which can be accomplished thereby, I was much interested, on the occasion of my recent trip to the Southern States, in the completeness and efficiency of the Southern Pine Association, which has its headquarters in New Orleans. In company with Mr. W. Gerard Power, president of the Canadian Lumbermen's Association, I visited the office of this organization and had a long and interesting chat with Mr. J. E. Rhodes, the energetic secretary and manager. At your request, I have much pleasure in giving the trade in Canada an outline of the worth and work of this progressive organization which has been in existence less than four years, but, within that time, has accomplished a great deal in making more widely known the merits of southern pine. The watchword of the Association is "Service" and the spirit of co-operation and unity animates all its activities.

Thinking that some of the work which has been undertaken may prove helpful and interesting to the various lumber interests in Canada, I will attempt to give you a general outline of what the Southern Pine Association is doing and endeavor to illustrate some of the features of its "Service." The majority of the facts I gained from conversation with Mr. Rhodes and a few of the members. The services of the Association are open to all manufacturers of southern yellow pine who pay an assessment of 9c per thousand feet on their monthly shipments. On July 1st next, this will be increased to 10c, which will be the maximum charge. The Association is engaged in the business of collecting and disseminating facts regarding the production and consumption of yellow pine lumber, and as to the usefulness thereof, information relating to the cost and method of its manufacture, actual sales of lumber and actual prices received therefor and in the maintaining of a bureau of grades and inspection and a staff of inspectors in the arbitration of differences between the subscribers of the Association and their customers and in selling such service with all lawful information concerning the production, manufacture and sale of yellow pine lumber. Part of the information gathered by the Association is received from lumber manufacturers in the way of statistical reports furnished the Association through such manufacturers.

Inspectors Who Settle All Claims

It may be interesting to point out here that a staff of 21 inspectors is maintained to settle all claims. These men go to the mills to see that the grades are kept uniform and leave a report with the mill showing the percentage of stock above or below grade. The Association also has a force of graders, and efficiency certificates are sent to the mills whose graders are regarded as competent and careful, and wages are paid to these employees on the basis of their efficiency.

Another interesting point in connection with the working of the Association is that the members under the term of their contract are assessed a maximum amount of 15c per thousand feet, but this is the gross fee from which 5c is deducted in consideration for information regularly furnished the Association. Under the terms of the contract the only penalty to which members are liable is the 5c per thousand they will forfeit for failure to give the statistical data requested.

Standard specifications are maintained for the grading of southern yellow pine, and the Association has adopted the policy of co-operating with the retail lumber dealers who are the chief distributors of the product of the organization. No changes are allowed in the standard grades without first consulting with committees appointed by the various territorial associations of retail lumbermen. The inspection service is of two kinds, namely, mill instruction and claim inspection. Under the former the stocks of subscribers are inspected monthly and report rendered accordingly, together with cards showing the efficiency of each mill grader, i.e., the amount of lumber inspected for each and the amount and percentages off grade and on grade.

How Disputes are Adjusted

Under the Claim Inspection work, disputes arising between subscribers and buyers, on stock shipped, are adjusted by an inspection of the stock. Charges are made for this service on a basis of the actual expenses incurred by the inspectors, not including his salary. This the Association collects direct from members, who in turn make adjustments with customers.

Claim inspections are made by Association inspectors only upon shipments of stocks manufactured at the mills, the owners of which

are subscribers. Fees are paid to the Association on the basis I have already outlined.

There are a number of statistical reports that subscribers are required to render on forms which are supplied for this purpose. "A Weekly Report on Order File" is rendered each week, showing the number of orders on hand Saturday morning of one week, the number of orders accepted from that Saturday morning to Friday night of the next week, the number of cars shipped during the week, and the number of unfilled orders on hand Friday night; also the actual production for the same period.

The production is arrived at by taking the log scale production and converting it to board measure by basing the average percentage of over-run as revealed by the last previous inventory. It is from these reports that the Weekly Trade Barometer is compiled, which is mailed to subscribers every Monday and reports are made out by the recipients and mailed on Saturday, so they reach the Association office not later than Monday morning.

There has been adopted for use by subscribers a form for rendering a uniform statement of costs. The form on which this is rendered shows the uniform classification and also has printed on the back detailed explanation of the various classifications, which renders each sheet self-explanatory. Operating Cost Statements are rendered on these forms monthly and copies sent to Mr. Rhodes, the secretary and manager. From these statements the Comparative Cost Statement, which has been very valuable to manufacturers is compiled in the offices of the Association.

What Each Monthly Report Shows

At the end of each month a report is required showing the Cut, Shipments, Stock and Unfilled Orders on hand at the first and last of the month, also hours of operation, etc. These reports are filled out and mailed to the office as soon after the first of the month as possible. It is from the shipments, as shown on these reports, that the subscription fees are based and from the information contained in the reports that the Monthly Statistical Statement is prepared.

Members are entitled to the services of the National Lumber Manufacturers' Credit Corporation, or "Blue Book." This includes the loan of the April and October editions of the book, Weekly Correction Sheets, Monthly Correction Sheets, Monthly Correction Supplements, Weekly Trade Reports and 25 Special Reports. On March 31st of each year, the National Lumber Manufacturers' Credit Corporation makes an accurate count of the number of special reports sent to each subscriber, and if they exceed the allotted 25, the subscriber is charged direct with the excess reports. Pocket editions can be secured by subscribers at special rates. The National Lumber Manufacturers' Credit Corporation will also furnish the branch offices of subscribers extra copies of the Blue Book at the rate of \$5 per copy for each issue, or \$10 per year for the two issues, which includes the correction sheets, etc.

In connection with the Traffic Department, the Association maintains a complete file of lumber tariffs and statistical data and any information desired is furnished subscribers upon request. Claims against carriers are handled for subscribers at a charge of 10 per cent. of the amount collected. Subscribers also receive the Freight Rate Books published monthly in three editions—Eastern, Western and Texas.

The Splendid Publicity Work done

The Advertising Work, conducted under the direction of the Advertising and Trade Extension Departments is broad, well managed and aggressive. Aside from the literature issued, forceful advertisements are placed in various farm papers and other publications which reach the lumber consuming trade. Frequently whole pages are taken in such widely known publications as the "Saturday Evening Post," setting forth in attractive form the value and quality of southern pine and the many lines in which it can be used economically and satisfactorily.

The Association through consulting engineers conducts laboratorial experiments, and from time to time, as occasion demands, employs special representatives to handle promotion and trade extension work, such as wood block paving, railroad construction, etc.

The Association also has the right to ascertain and verify the output of the mills of each subscriber or member and to cancel any

membership for any wilful violation of the regulations or for any refusal to abide by the inspection and grading of the lumber manufactured by the subscriber or the decision of any committee of arbitration thereon. There is, of course, an opportunity to appeal against the decision of the inspectors in regard to grading. If the contention of the subscriber is upheld the Association stands the expense of the appointment of disinterested parties; if wrong the subscriber has to bear the cost. I understand that the total revenue of the association is about half a million dollars annually.

I may say that a booklet is issued regularly giving a complete list of the subscribers and officers of the Association. Its membership embraces the states of Alabama, Arkansas, Florida, Georgia,

Louisiana, Mississippi, Missouri, Oklahoma and Texas. There are two directors from each state. I hope that the foregoing facts may prove interesting and instructive and, while some of the service features could not be adopted in Canada, owing to geographical position, diversity of interests and different marketing conditions, there are perhaps some pointers in regard to trade information, traffic, inspection, grading and publicity that may prove useful or suggestive in connection with the extension of the service and co-operation of interest in the Canadian Lumbermen's Association and the Wholesale Lumber Dealers' Association, both of which are doing effective work and should have the warmest support and encouragement from every member of the industry in the Dominion.

Should Yard Men Charge for All Deliveries? *Expense of Maintaining an Equipment is so High That the Service Can No Longer Be Furnished Free—Necessity for Adopting United Move*

In these days, with the scarcity of help and high wages, the question of free delivery of lumber is a live one with the average retail yard man.

In other lines of business, merchants are eliminating delivery as far as possible. The matter is receiving a great deal of attention at the hands of local associations of citizens. In one Western city a fund has been established by the mercantile interests for the purchase of advertising space in the newspapers to educate the people into carrying their parcels home. The big departmental stores have cut the number of their deliveries down from four and five a day to three, and, in another city, a leading grocer is advertising special bargains under the heading of "Cash and Carry." "All goods sold at the price named to be removed by the customer from the premises on the day on which they are bought." The reductions are worth while and many persons are taking advantage of his offers. In certain other enterprises, although patrons are aware of the difficulties of delivery, they have not manifested much disposition to carry home their goods, for the simple reason that no inducement is presented to do so. The buyer who shoulders a bag of flour, a bushel of apples, or a stone of rolled oats, has not been able to get such goods any less than the staid and dignified person who insists that his purchases be sent up to the house. Until some concession is made most persons with bulky goods will, at any rate, allow the merchant to struggle with the distribution problem. If a small discount were allowed nearly all parties would take their merchandise along with them in order to save a few cents in these days of the excessive cost of living and special war levies. Unless such an arrangement is brought about, merchants will in the great majority of instances have to go on delivering their wares.

In the case of lumber, lath, sash, doors, blinds and shingles, conditions are vastly different. Their bulk and weight prevent the average buyer from personally conveying home the goods, unless he possesses a horse and wagon or a motor truck. Thus the delivery problem as applied to the ordinary yard man, planing mill or timber merchant is one which does not come under the general plan which the city merchant is seeking to work out.

Problem is One for Local Solution

From interviews secured with retail lumber men in various parts of the country, there is some difference of opinion in the matter of charging an extra fee for delivery. Many strongly uphold the practice and others declare that delivery should be figured in overhead expenses and thus a buyer know definitely what so many thousand feet is going to cost him laid down at his door. No general rule can be applied. The adjustment of this perplexing question appears one for local solution and depends upon the practices which have prevailed in certain cities and towns. Most dealers, however, even when adopting the practice of free delivery, charge for this service when the goods have to be hauled outside the corporate limits. The chief trouble with free cartage is that contractors, and private builders are apt to impose upon the generosity or good nature of the yard man or the building supply firm and require them, at times, to make several trips whereas one should usually answer the purpose. In Quebec city, the abuse became so flagrant that a local association was formed and free delivery eliminated altogether. It is stated by the officers that the plan has effected a great saving and worked out to the mutual advantage of customer and dealer. The cost of delivery on small orders often amounted to more than the profit on the stock. The system which is of such advantage in the Ancient Capital, may not develop with equally satisfactory results in other centres as delivery in Quebec is

very expensive and difficult, owing to the many hills. However, there appears to be a growing feeling among the yard men in the various centres that due to the high cost of maintaining a delivery equipment, customers should assist in paying for this service by handing over a reasonable amount.

The following views of a number of retail lumber dealers shed much light on this interesting subject.

S. Anglin & Company, Kingston, Ont., say:—"We have never had free delivery in this city. Our prices on lumber and other merchandise naturally associated with lumber, are made at our yard here and cartage is charged according to the quantity and distance. We have occasionally met with customers who objected to paying delivery charges, on the grounds that they were not accustomed to pay them in other towns; but we have always maintained that a separate delivery charge is absolutely fair to both the customer and the dealer. We have pointed out to them that we could not afford to maintain horses and drivers for nothing. We pay out annually, a large amount of money, for hay and oats, and we could not afford to do this without charge. We have really never had any serious difficulty in obtaining payment for delivery and we understand that all the dealers in this city follow the same rule. The Railway Cartage Agencies charge at the rate of 70c a ton here. Our rate of charge is something like this—for a distance of ½ mile or less, the quantity of goods weighing a ton or less, drawn by one horse, 50c; for the same quantity for over ½ mile, and not farther than a mile, 75s; for two miles \$1.25. For greater distances, special prices are usually made."

Strongly Endorse Special Charge

James M. McBride & Sons, of St. Catharines, Ont., write:—"We have heretofore not made any extra charge for delivery, except in a very few special cases. Of course, our trips may not be as long as in larger cities, but, owing to the growth of the city, they have been extended considerably in the last two years. Frequently, on small orders, the cost of delivery eats pretty well into the profit on the order, nearly wiping it out entirely, and this has to be made up on larger orders. We are therefore now in favor of a charge covering at least a part of the cost of delivering."

The McLean Lumber Company, Limited, of Windsor, Ont., assert:—"We are in sympathy with the proposition to charge for the delivery of lumber, in fact, from the viewpoint of self protection it is a necessity. It is our custom to make a higher price on small lots in order to care for delivery, otherwise, in many cases, the delivery is worth nearly as much as the order. We have made not extra charge for regular stock deliveries which is supposed to be covered by general expense, and is difficult to regulate. This should be a matter for the Retail Dealers' Association to deal with."

The Small Sales Take Off Profit

John D. Campbell, of Cornwall, Ont., is in favor of stopping all free delivery, and adds:—"I have never charged for delivery, as most people think prices now are exceedingly high for lumber, and with carting added they would go some place else for it. But if all dealers would charge a minimum price, so everyone would know and expect to pay carting, there would be no trouble on that ground. The dealer is certainly 'up against it' when he just asks a small profit on his lumber and then has to pay delivery and upkeep of a man and team to handle same. This is especially true when a person asks for a few boards or scantling, say 10 or 12, delivered a mile or two—what with the loading and measuring and going and coming back, the result, in the accounting up of the profit or loss, shows one behind. If people

would only order enough to complete the work at once instead of making the dealer make so many trips with a small amount of material it would be far better. One would not mind the delivering on a large order, say 1000 feet or more, where he could take a good sized load and thus eliminate all the loss on several small jags. He would not then be behind in the accounting. I find the experiences as told by Mr. J. O. Chalifour, of Quebec, in the "Canada Lumberman" exactly as I find them in my town about the delivering of a few plank, and carpenters asking for a few boards five or six times a day, etc.; also the paragraph on "Terms Cash or net 30 days," I read with interest. A great loss is incurred by small debts by hundreds that are never paid. If the dealers would co-operate in these matters I think it would bring good results to all parties concerned, both buyer and seller."

H. J. Hall & Son, of Kitchener, Ont., declare:—"We deliver free within the city and Waterloo, which is practically part of our city, but charge extra for deliveries outside according to the distance. Wherever possible, we try to get a little extra on small orders, to cover extra expense in carting, but we are often obliged to make small deliveries where the cost is more than the profit on the material. These things are hard to overcome unless there is an understanding among all dealers with respect to the charge for delivering, especially on small orders. We would be pleased to fall in line with any plan whereby we could be paid extra for delivering."

Must Arrange Suitable Cartage Tariff

"In the matter of free delivery of lumber we might say that we have always had free delivery in London. However, the cost is becoming so great that we will be obliged to go into the matter and arrange a suitable cartage tariff," say the George H. Belton Lumber Company, of London, Ont.

D. Aitchison & Company, of Hamilton, think that the delivery question is getting to be a more costly business with each ensuing year, especially at the present time, when wages and horse feed are so high in price. Should a general move be made to charge for delivery, they would be glad to fall in line. The company add:—"All lumber is delivered free of charge in this city (except where it goes to a considerable distance outside of the limits) to all contractors, and in fact, to most of our customers. Sometimes when an order is small we make a charge for delivery, but in most cases where there is only a small lot required, the order has to wait until we have something else going in the same direction."

Many Clients Abuse the Privilege

J. O. Clermont, of Valleyfield, Que., writes:—"I have to say regretfully there is not any system adopted here and that delivery is made gratis. This, as you remark, often results in certain of our clients abusing the privilege. Several among them only order their material in proportion as their work advances, on purpose to make it easier for the carpenters they engage who often are not sufficiently competent to foresee what is required in the work. I have frequently stated that the expense of delivery on small orders exceeds the profits of the sale, a thing which certainly would not exist if we adopted a scale of delivery charges and it was strictly followed by the lumber merchants. If, by any chance there is any possibility that you are instrumental in bringing about an agreement between lumber merchants to abolish free delivery we shall certainly be grateful."

Jos. A. Likely, Limited, of St. John, N.B., say that they charge

for cartage on all orders delivered but only enough to cover the cost of the service of the teams.

Favors Free Cartage to All

The R. E. Butler Lumber Company, of Woodstock, Ont., express their views in support of free delivery as follows:—"We always deliver, free of charge, any orders within the city limits, and, of course, realize that, on the small orders, we make no money, but this expense is always figured in our overhead. We figure what it costs to keep equipment and men to do this work, and this cost is taken into consideration when basing our percentages for doing business. Of course, Quebec is a large city, and we can understand the reasonableness of this charge providing they have to cart their lumber any great distance. Our city here has only about 9,000 population, and we can go to the farthest extremity and be back in an hour's time, as our yard is centrally located. Then again, small orders often lead to large orders. We understand that the Quebec dealers charge 75c for a one-horse load and \$1.25 for a two-horse load. We would take it from that, that it would mean no difference whether the customer got two thousand feet of lumber or fifty feet, they would still make this charge. This does not appear right to us. We think the man purchasing the two thousand feet of lumber should not be asked to pay anything for the delivery in the city, and then again, the man who has bought the two thousand feet may want fifty feet more to finish the contract, and are you going to charge another 75c for delivering this? It strikes us that all this should be figured in overhead, and when a man buys lumber from you at so much per thousand and feet, it should be f.o.b. on the job. At least this is the way we see it in this locality. Of course, we have our regular charge for delivery outside the city limits. We might remark that the way we get around these small orders is to hold them, if possible, until we have some others to go in that locality, and this reduces the trouble, inconvenience and expense considerably."

Divergence of Practice in Toronto

In Toronto, there is a wide difference in the matter of charging delivery outside the city limits. We might remark that the way we cents to one dollar on all deliveries up to twenty dollars, but above that amount no levy is made. On all small orders there is a blank line in the slip which the customer signs wherein the charge for cartage is filled in. Motor trucks are used principally for the delivery of scattered business. Generally such goods are routed for certain sections so that when one trip is made, several orders can be filled at the same time. This applies principally to repair and alteration requirements.

Another firm in a different part of the city stated: "On all small orders, unless the party is a regular customer we endeavor to add a little to the price of the goods, depending on quantity and distance to be covered, for delivery. The sum is usually based on so much per thousand, but on all large orders inside the corporation limits, no extra tax is levied. We have no separate line on our receipt slips which are signed by the customer covering cartage. We find that small orders often lead to larger ones, and it would be very difficult to lay down a hard and fast rule regarding what charges should be made for delivery. Much depends on the standing of the purchaser, the quantities, the distance to be covered, when desired, etc."

Lumber Driving Conditions Good in the East

The log driving conditions for the shorter drives in the central part of New Brunswick have been good. The recent warm weather has brought the water in the majority of the streams to a good pitch and late rains have helped out matters considerably. J. M. Scott, operations manager for the Fraser Companies, Limited, reports that that firm's drive on the Rockwell branch of the Oromocto is out in the main stream and that the same is true of the Yoho and north branch Rusia-gornish drives. The Nashwaakis drive has also made good progress.

Driving started some time ago on Cain's River and other branches of that stream and conditions have so far been very favorable. The cut of bank logs along the river between Fredericton and Springhill has been decreasing steadily during the past few years and this season is below the average. George Kilburn, of the Nashwaak Pulp and Paper Company, St. John, estimates that the lumber which the company will drive on the Nashwaak this spring will be about twenty million feet. This will be rafted at the mouth of the river. Driving on the Nashwaak is now in full force. Other drives are on the way and the season is regarded as very favorable so far. The total cut during the last season is considerably less than it was the year previous, owing to scarcity of help.

The Log Booms at Fredericton, N.B.

Practical Ideas on Present-Day Problems

Real Service and What It Means

WE can talk about service in the lumber business; we can advertise beautiful homes, furnish plans, provide plan books and guarantee material lists, all of which are good—FINE, but unless we know well the fundamentals of our business we are merely putting silk frills on a pair of overalls. Here are a few fundamentals:

1. Know your business—KNOW IT.
2. Give the customer what he wants when he wants it.
3. Good lumber at reasonable prices—the same price to all.
4. What is good for the customer is good for you.
5. Don't be afraid to work.
6. Be fair and square with all men—your competitors included.

Sweeten these up with love and unselfishness and then—and not until then—can we ever put real service to work in the lumber business, or any other business either.

Before you can render proper lumber service to your community you must know your business—you must have a thorough knowledge of woods and their manufacture; you must know how to take care of the finished products and their uses; you must be able to keep your place of business as spick and span as a Dutch Cleanser dish; you must know how to estimate; you must know how to plan homes and build them, and a good many other things that you can't get from a book. And any man who gets a swelled head about his knowledge of the lumber business has a brain full of sawdust because he can't learn this wonderful business in a day, or a lifetime. You can't talk about service when you figure up an estimate for a barn and when your customer gets through he finds that his bill is half as much again as he expected it would be; and you are not helping to fill the pail with the milk of human kindness when you dexterously slip a No. 5 board into the farmer's load of No. 2 common when the farmer's back is turned. Talk about service—it will be well to learn to know the meanness of petty cheating first. When we learn this we'll go a long way toward delivering the goods with all the freight charges prepaid, and until we do learn this we will be the prime cause of a lot of dissatisfaction and hard feelings on the part of lumber-users against what I believe to be the finest business in the world. Service means efficiency and honesty.—George W. Bulmer, before Western Retail Lumbermen's Association.

You Owe Your Town an Active Life

CO-OPERATION between business men in small towns is the only hope of keeping your town on the map. You are the centre of enthusiasm, and "U" is the centre of the word enthusiasm. Don't be a pessimist; be an optimist. Be an optimist. An optimist is a man who looks outdoors on a dark night and sees a little light, whether there is one or not; and a pessimist is one who sneaks around and blows out that light.

No town owes you a living, but you owe your town a life—an active life of service. It is not how much you can get, but how much you can give to your community. To get to heaven in the real sense of the word, you do not die, but you live, in the right manner, and this includes respecting the rights of others. Only 5 per cent. of the average business men succeed to-day, and of that 5 per cent. they are only 50 per cent. efficient, so in order to be successful to-day you need only be 50 per cent. efficient if you want to be in the successful class.

Some men are afraid of advertising, but it is the only possible method of success in any line. The town that has a 23-mill tax levy attracts the dead ones, who move there to die physically, but the town with the 46-mill levy draws the live wires, for only a live wire, a man who can travel upstream, can stand the pressure in the latter town, and those fellows go to the live town, not to die, but to live and live right.

Don't expect to "get by" without making enemies. They are the best thing you can have. Your enemies keep you at high pitch and keep you on your guard, which is necessary if you are to succeed.—C. M. Johnston, before South Dakota Retail Lumber Dealers.

War and the Business Man's Responsibility

IN addition, if business men sit back in this time of great change, when there are forces at work affecting our entire structure, forces not alone in this country but all over the world, action will be taken by the government vitally affecting business, affecting it to its roots, and the judgment and experience of business men will not be at hand when the decisions are being reached.

The great movements afoot in this country and abroad are to a great extent irresistible. Great changes are to be made. The most that the business men can do is to guide, to give the benefit of their experience and their knowledge. Things are to be done whether we like it or not; it is purely a question of whether we come forward and have our part in what is being done, or whether we sit at home and growl about the results.

In my judgment, it is manifest that business men are called upon to do three things: First, they are called upon to arouse themselves to a sense of responsibility for what is happening in connection with these industrial problems. This is our government. We have a part in it as much as anybody else. It is not enough for us to sit at home and say that the government hasn't called upon business men or hasn't put them in authority, or hasn't created an organization to meet the business problems of the war—we have knowledge, we know facts, we have experience; there is a responsibility and a duty upon us to do something.

The second thing, it seems to me, is that business men must study conditions. What are the forces at work? What are people trying to do? What is the machinery in Washington? What are the influences? Who are the people who are controlling events, and what are they trying to do? What are the ways in which we can do our part? Of course, we can't expect to steer the boat; we can't expect to control what is done, but we can expect to pull an oar or two, to have a part. We can sit in and find what that part is. We can play the game!

The third point is that the only way for business men to accomplish results is through organized effort, through associations such as this studying problems concretely.

What are the problems of business men, as you see them, in connection with the war (not selfishly, but broadly, in the interest of all)? What should the country as a whole do to preserve itself industrially? What should your business do? Business men as a whole, through national organization and effort, should have views, plans, thoughts about what is being done, and should express them strongly and forcefully. They should make clear the thought and judgment of business men as to what the country should do to meet the business problems of the war.—Waddell Catchings, before National Wholesale Lumber Dealers' Association.

The Retail Lumberman and Advertising

MOST people know more things about advertising that are not so than any other subject under the sun. Once in a while I run across a man who doesn't believe in advertising—one who says that it doesn't pay, and that advertising is a huge economic waste; that millions are spent and wasted in artificial attempts to stimulate selling, to the injury of both buyer and seller.

One of the leading manufacturers of paints spends 3 1/3 per cent. of the total sales. The big department stores fairly dominate the newspapers with their big spreads. The average department store spends not more than 3 per cent. for advertising. The effect of advertising is to decrease rather than to increase the sum total of their selling cost. Advertising is no more and no less than an understanding of the people and the conditions one is attempting to reach, coupled with a thorough understanding of the exact relation of the thing advertised to the people and conditions.

The world bows to the man who knows. No less does the public bow to and respond to the man who knows and speaks through his advertising copy. The popularity of a product cannot be gained by spasmodic advertising. Back of the advertising there must be a plan; there must be a purpose; there must be a continuity. The public likes to purchase the popular article; the public likes to know why, and the public likes to be constantly reminded. There are only two persons who need not advertise—first, the man who has so much business that he cannot take care of it well; and, second, the man who has so little business that it is not worth while. All others should advertise.—Albert Million, before South Dakota Retail Lumber Dealers.

The exports of Canada to the United Kingdom have increased tremendously since the war began, and some forms of lumber have tended to swell Canada's war exports considerably. In 1917 the Dominion sent 50 per cent. more spruce and other deals to the United Kingdom than in 1913. The price so increased that the value of this form of export has nearly doubled, being \$8,594,803, as compared with \$4,683,821.

How Canadians Hustled Out the Timber

Within Three Months Battalion was Raised in Dominion, Sawmill Built in England and Lumber Delivered to Imperial Authorities

By Major J. I. Hartt, M.P.P., Officer Commanding 48th Co. C.F.C., B.E.F.

Major J. I. Hartt, Orillia, Ont.

When the final history of the Great War is written, the part played by Canada will loom out large and bright, and when all the "cards are placed upon the table," Canadians themselves will be astounded at the results achieved.

The work of one section in particular of the Canadian Army will receive the prominence it has earned by its untiring efforts and devotion to the cause—I refer to the Canadian Forestry Corps, a branch of the service which has hitherto received little publicity, but which has accomplished all, and even more than it has been called upon to do.

After a little over one year's warfare the British Government realized that to cope with the insatiable demand of the army in the field for timber, it would have

to specialize and create an organization equal to the gigantic task, especially as the work of bringing timber over the seas was becoming increasingly difficult owing to the scarcity of tonnage through the activity of the German submarines.

The work of supplying timber in the first year of the war had gone on in a haphazard kind of way, incompetent and inexperienced officials mismanaged the work and treated it in an indifferent manner, recalling to mind the words "too late" in a famous oration of Mr. Lloyd George, and giving every evidence of the proverbial "muddling through" of Britain.

Valuable lives were being sacrificed daily, and with the object of setting its house in order the British Government appealed to Canada for help. It was natural that the appeal should be made to that land of immense forests, with its practical lumbermen, and it was not in vain, for as readily as Canada answered the call for men to fight the Huns, just so readily did she send her sons to attack the giants of the forest.

How the Appeal was Answered

The appeal to Canada took the form of a cable dated 19th February, 1916, from Mr. Bonar Law, Secretary of State for the Colonies, to the Governor General, to the effect that His Majesty's Government would be grateful if the Canadian Government would assist in the production of timber for war purposes.

The response of Canada took a practical form—six days from the date of the cable referred to, viz., on the 25th of February, 1916, an establishment was authorized by the Department of Militia and Defence at Ottawa for the formation of a Forestry Battalion to be known as the 224th Canadian Forestry Battalion. The command of this unit was given to Alexander McDougall, of Ottawa, a well-known figure in Canadian commercial life, and the personality of this man, coupled to his untiring efforts, has no doubt resulted in the high efficiency of the Corps.

The first draft of the 224th Battalion landed on British soil on April 28th, 1916. Two other drafts quickly followed, bringing the nominal strength of the battalion on May 28th, 1916, up to 1,609 all ranks, completely equipped and ready for lumbering operations.

That no time was lost in getting to business is evidenced by the fact that on May 13th, 1916, the first sawn lumber was produced by the mill installed at Virginia Water, near Egham, in the County of Surrey, England.

Previous to this, however, large quantities of logs had been felled and hewn into ties, until the mill could be operated.

The point that cannot be overlooked at this juncture is the practical illustration of real Canadian hustle—within three months from the day the British Government sent its request to Ottawa, the battalion was raised, it and its machinery were despatched to England, its first mill was built and lumber was being delivered to the Imperial authorities. As a sample of organizing skill this would be hard to beat.

In the ranks of this Forestry Battalion were a considerable number of technical experts, such as sawyers, edgermen, saw hammerers, millwrights, saw filers, etc. The call had been for practical lumbermen, and Colonel McDougall saw to it that he got them. Many were over military age; others had been rejected for the fighting forces for one reason or another, but all were able to do good service as lumbermen.

Many Sawmills Were Installed

The battalion was quickly followed by similar units from Canada, and mills were installed throughout the length and breadth of Great Britain from the far north of Scotland to the south of Devon. The Imperial authorities, however, had no intention that the Canadians should remain solely in Great Britain, and early in May, 1916, the late Lord Kitchener urged that a large proportion of them might be sent to France. This resulted in another cable to Canada, to the effect that production was held up for lack of men, and His Majesty's Government again turned to Canada for help. The answer to this cable took the same practical form as in the first instance, and battalions of lumbermen were quickly organized, equipped and sent overseas.

Colonel McDougall and his men made a distinct impression upon the Imperial authorities, so much so, that at the suggestion of the late Lord Kitchener, the Colonel was sent to France on June 7th,

The boys enjoying their midday meal after a hard morning's work.

1916, to inspect the forests with the view of ascertaining the nature and scope of the work to be done and the technical plant required.

Until they could get their own machinery the Canadians made use of Scottish mills, each with a capacity of about 5,000 to 7,000 feet, b.m., for a ten-hour shift, although this output was greatly increased by the mechanical ingenuity which our boys applied to these mills. As quickly as possible Canadian mills were put into operation, these mills turning out 25,000 to 30,000 feet, b.m., and even more, in a ten-hour shift.

It was soon found necessary, owing to the rapid growth of the organization, that it be formed into a Corps. This was carried out, and Colonel McDougall became Brigadier General and Director of Timber Operations, while Major B. R. Hepburn was promoted to Colonel and Deputy Director of Timber Operations.

A base training camp was opened at Smith's Lawn, Windsor Great Park, on January 6th, 1917. This site was secured through the kindness of Mr. Forrest, the Crown Receiver. It is situated in the Royal Borough of Windsor in close proximity to Windsor Castle. His Majesty the King was a constant visitor to the base and also were other members of the Royal family.

The Forestry Corps Grow Rapidly

By the middle of June, 1917, the Corps had grown to a strength of 15,000 in Great Britain and France—22 Companies operating in Great Britain and 28 Companies in France.

On January 1st, 1918, the strength had increased to over 18,000 Canadians, together with a number of Portuguese, Finns, prisoners

of war and attached labor. Today there are 32 Companies in operation in Great Britain and 55 in France.

The operations in France extend from the Jura mountains in the southeast to the Landes in the west; in the Gironde and the Haute Morne, around Bordeaux and in the forests of the Somme.

Some companies are far removed from the scene of warfare, whilst others work under the shadow of the guns, being frequently shelled by the Huns and attacked from the air by the enemy birds of prey. Several members of one company were given the Croix de Guerre with bronze star for their work under fire.

This is but a very brief resume of the work of the Corps, but it will serve to show how military problems can be quickly and satisfactorily solved when business methods are applied. Actual figures of production cannot be divulged at this stage, but we know they are beyond anything dreamed of by European experts, and would also cause our Canadian mill proprietors to "sit up and take notice."

We are justified in saying that but for the timber supplied by the Canadian Forestry Corps, the work of the fighting troops would have been seriously impeded—in fact we can go further and say that much of the work accomplished would have been impossible without their assistance. When one thinks of the muddy fields of Flanders in the early stages of the conflict, with the men imploring for timber to support their trenches and dug-outs, with those selfsame trenches knee deep in slime, it can be readily understood how thankful the troops must be to the Forestry Corps for the abundant supplies of lumber sent up to them.

The General Officer commanding the Canadian Corps has said that he will not allow his men to attack a position until that position has been prepared in every detailed particular. Nine-tenths of this preparation is elementally dependent upon lumber supplies. Nothing can be moved over shell devastated ground without improvised plank roads or railways resting on wooden ties. Shelters for men, trenches and saps, and the innumerable structures of an advancing army are made of wood.

The Eastern Cut is Greatly Reduced

Lumber operators who have spent years in the business in the province of New Brunswick all seem to agree that the cut this year will be nearly fifty per cent. below normal. A few years ago a statement of this kind would have caused mild consternation, but not so during the present unsettled times.

While some operators contend that the slump in the cut is due to labor conditions the vast majority base the result on lack of transportation. At the present time the limited space allowed for lumber is not sufficient to warrant any large cuts, as only sufficient is being shipped to keep the overseas market going. By smaller cuts they feel that they can accommodate the demands and not have any quantity on their hands. Many are optimistic and feel that they may be able to ship more timber to the Old Country this year than last. They base this claim on the fact that last year many of the forest preserves in the British Isles were cut down by the forestry battalions and the Old Country market was not in such dire straits for material as in former years. Much of this lumber has, during the past year, been absorbed in new buildings and war work, and there will, they believe, be a greater demand this year for Canadian lumber than there was last.

How much cargo space is given over for lumber depends on the necessity in England and France for same. The domestic market will also absorb a much larger quantity of material than in former years, owing to the boom on for building wooden ships. This is especially true of Nova Scotia, where many wooden vessels have and are in the course of construction. Owing to this, operators have been making efforts to get out timber suitable for shipbuilding instead of so many deals. In many respects this will also be adhered to in New Brunswick, but the cut in the latter province is so large, even when reduced, that shipbuilding operations cannot absorb any very considerable quantity of the total.

The lumber operators in the Maritime Provinces of Canada are not the only ones affected by conditions in the world. A prominent operator from Maine, in conversation with a correspondent of the "Canada Lumberman," said that the Maine cut would be at least twenty-five per cent. below normal. Last year one billion feet of pulpwood was cut in the state of Maine and six hundred million feet of pine box boards, without taking into consideration the other divisions of the lumbering industry.

As far as the eastern provinces of Canada are concerned, little or no difficulty is expected in bringing down the drives. Already large crews of men are at work on the St. John River and its tributaries and splendid headway is being made rafting the logs and making preparations to have them towed to the booms.

Big Possibilities for Carbon Fuel

Walter Thomas, of Nanaimo, B. C., writes the "Canada Lumberman" on the subject of carbon fuel, in which he says:—I have just received a four-page letter from the Australian Government, and also from the Egyptian and Argentine authorities who seem to display far more interest in my proposition than our people do at home.

I have for years been at work on waste, but being a gas man I thought the people needed gas. I found that, at least, in the West where hydro-electric power abounds, the need for power by means of producer gas was limited, so I conceived the idea of manufacturing a material product—carbon fuel—and to my surprise my process was successful beyond my wildest dreams.

I do not think it would be wise to give all the details of my proposition away as I have found blank opposition from all the university people with whom I have come in contact, so I have decided to leave Canada and make my mark in other countries and return when we have something else in the Dominion other than potatoes and pork.

Everyone knows that the same elements are in wood as in coal, only out of proportion. I have simply, "by a process," made from wood a superior fuel to any coal on the continent, by reducing the concentrated heat-giving energy of three tons of wood or straw into one of carbon fuel. It gives a fuel low in ash, no smoke and no sulphur.

I understand there is just as flagrant a waste of wood in Eastern Canada as out West. The kind of wood does not stop the manufacture of carbon fuel. Fir and pine are, of course, the best, as they contain the oil necessary to my process within themselves to carry out the whole operation. In fact, I prefer roots and stumps to sawmill refuse. Hand clearing operations can be carried out on a large scale at a profit.

Carbon Fuel.—This is a fuel made from waste material found in all countries of the world. The following refers to a few sources of supply.

Straw.—According to estimates made by professors of the Prairie universities, there are twenty million tons of straw burned every year on the Canadian Prairies. This amount of straw would produce seven million tons of carbon fuel, containing from 90 to 94 per cent. of fixed carbon, worth \$10 a ton. The cost of manufacturing, including all expenses, would be less than \$5 a ton.

Wood.—The wood wasted in British Columbia alone, including sawmill refuse, is about 15,000 cords per day. This, if converted into carbon fuel, would make 8,000 tons, worth \$8 a ton; the cost of producing would be only \$4 per ton. The same can be said of the three west coast states—Washington, Oregon and California.

Different Grades

There are three different grades of carbon fuel:—

(1) Domestic fuel, superior to coal or wood on account of cleanliness, available heat units and cheapness.

(2) Light industrial fuel, suitable for locomotives, blacksmith shops, steamboats, brass foundries, bakeries, confectioners, brick and lime burning and all industries requiring heat of medium temperatures, free from smoke and sulphur and low in ash.

(3) Metallurgical coke, suitable for the manufacture of charcoal, pig iron, steel and all blast or reverbratory furnaces.

Markets.—The Alaska trade calls for tens of thousands of coal every year. All this coal contains undesirable qualities, such as high volatiles and a large percentage of ash. Special concentrated carbon fuel made for this trade, by this process, would put this coal out of the market.

With a perfect fuel, the matter of displacing gasoline and distillate on our fishing fleets on the Atlantic and Pacific is now within the range of possibility.

Blacksmith coal and metallurgical coke are imported into British Columbia and retail at three times the price at which carbon fuel can be produced, and besides the money would be kept at home.

The Cost of Plant.—The cost of a carbon fuel plant, capable of producing 100 tons per day, would be only 50 per cent. of a by-product coke plant of the same production per day.

Comparative Analysis

Average bituminous coal

	Moisture	Volatile	Fixed Carbon	Ash	Sulphur
American	2.00	32.90	53.08	11.34	0.68
Connersville coke	88.96	9.74	0.810
Vancouver Island coke	77.00	23.00	unknown
National Carbon Fuel	3.00	3.50	90.00	3.50	0000

This analysis of the carbon fuel was made by the official assayer of the Government of British Columbia. Other analyses made by three eminent chemists in British Columbia confirm the above analysis showing over 90 per cent. fixed carbon in national carbon fuel.

I am willing to accord bona fide enquirers every opportunity to investigate the merit and worth of carbon fuel, but have not time to bother with mere curiosity seekers.

The Problem of Wheel Faces

The questions asked recently by a brother band-filer who was in trouble may give many mill men food for thought in regard to wheel faces. The filer I have in mind in telling of his troubles asks if band-wheels should have crown, and states that after his wheels were dressed off flat they had great difficulty in keeping the saws on them, says R. C. L., in the "Box and Barrel."

With the sketches herewith, the writer hopes to cover the important subject fully which may be the means of helping other mill men. In the first place, crowned band-wheels were once almost universally used, but they are being fast discarded and by most modern filers are considered not only useless but harmful to the band saw and its cutting qualities. There are many filers who use crowned faces today and get satisfaction, but it stands to reason that the more crown used on the band wheels, the deeper the tension must go in the saw to overcome the crowning condition of the wheels, since the strain of the properly tensioned saw must come on the edges only. As for the crown tending to hold the saw in place or holding it up to the cut, the writer has had no trouble along this line with perfectly flat-faced wheels. Possibly the statement may sound strange to many, but with flat-faced wheels and a properly tensioned saw, I consider my band wheels crowned with air which enters between the saw and band wheel while running and holds up the loose centre. In other words, my saws while in operation are air cushioned in their centres. In fact, from the tire edge to edge of the saws but more so in the centre. This air cushion with the tight edges of the saw and proper pitch to the saw teeth will hold any saw up to the cut and in its right place, provided it has the proper depth of uniform tension.

The misleading trouble makers of the band wheels are exposed to plain view in accompanying sketches. Fig. 1 shows the common condition of band wheels that were once flat-faced, but refacing was put off too long, as in most cases, until the front edge of the wheels were worn down some two or three inches from the edge, leaving a ridge which takes the strain off the extreme edge of the perfectly tensioned band saw and leaves several inches of loose unstrained-up saw to dodge and snake in the cut. Now, this condition is bad in the extreme and most difficult to fit saws to work as should be.

To show the difficulty experienced by filers in fitting saws to correspond with this condition, the reader is referred to sketch, Fig. 2, which shows just how a perfectly tensioned saw would fit such a wheel-face when in operation. Note that band wheel's face section is shaped as the above sketch with an even-tensioned saw in place, also note the dark laticed lines extending down from this wheel-face which represents the tires of the saw or its place of greatest contact with the band wheels. Now, to overcome this condition with the band saw, it will be seen that a filer must open up his saws greatly in the front quarter to let the tooth-edge of the saw down on the edge of the band wheel which would change the tire from the high ridge seen at the arrow in sketch to the edge where it should be. It is a case of fit the saw to the wheels or else there will be some three and one-half or more inches of the cutting edge of saw outstanding without strain, which is bound to cause snaking and dodging in the cut, with regular true-circle tension.

On the other hand, to fit the saw to the wheels in that worn condition, it will be seen that it takes excessive tension in the front quarter of the saw, which is bad for the saw and may cause quarter cracks. Again, the front tension pulls out fast and the back of the blade must be continually stretched to meet these conditions.

In sketch, Fig. 3, is shown the operating condition of a perfectly flat-faced band wheel with a perfectly tensioned band-saw in place. Note the raised central portions of the saw, which, with deep tension, never comes in direct contact with the centre of the flat-faced wheels,

but is air-cushioned with whirling air entrapped with running at great speed.

Note the laticed lines from edge to edge of the saw, which is the right idea. To prove my theory, go extra deep with the tension on an old saw and note the bright worn lines on the edges or tires on inside of the saw, while the central portions are of a dull color. Again, when this saw is strained up on the mill, tap lightly with a hammer on edges, then in centre, and note the difference in the sound. I think the trouble with my brother filer was that his saws were too shallow tensioned and the strain comes in the centre of the saw instead of the edges, which would cause a saw to lead easily back or forward at little pressure.

My inquirer also asked: What is the real use in crown in band saws? It holds up the back, takes up expansion of tooth-edge—it is good to use.

News Happenings from the East

The Miller mills, at Pokiok, were put up at public auction in St. John, N.B., last month, and were knocked down for \$9,000. In addition to a large sawmill and two lime kilns, there were five houses and 20 acres of freehold property facing the St. John River. The price secured was a low one, but owing to conditions competition for the property was not very keen. It was purchased by Harry Carson, who says that he will operate the mill just as soon as the can sign a contract for logs. The mill is in very good condition, and was worked until the fall of 1917. The reason it was sold was on account of difficulty in securing logs.

The E. Burt Lumber Company's mill at Burt's Corner, in York County, N.B., began operations for the season recently. This company have cut upwards of four millions of spruce and hemlock, to be manufactured at their mill on the Keswick. They are looking forward to a prosperous season, as the lumber market looks good.

The lumber mill of Stetson, Cutler & Co., in St. John, N.B., started up lately.

The first raft of logs to come down the Kennebecasis River this year arrived in St. John on April 14. It was towed by the well-known firm of James Holly & Sons.

Following an interview recently with the Provincial Government at Fredericton several smaller licensees of crown timber lands completed the organization of an association known as the Lumbermen's Protective Association. The new organization has as its chief object the securing of a readjustment of the distribution of the crown timber lands of the province. It is claimed by the association that the existing distribution of the crown lands is inequitable, the contention being put forward that other larger operators have more lands than they reasonably require, and that the excess holdings should be placed at the disposal of the smaller licensees. Before the matter is finally adjusted a lengthy controversy over the whole system of licensing the crown lands may develop, as the larger licensees claim that they do not hold more than sufficient lands to afford timber for the capacity of their plants. The officers of the Lumbermen's Protective Association are: D. J. Buckley, Newcastle, president; F. D. Swim, Doaktown, vice-president; George M. McDade, Chatham, secretary-treasurer; J. D. Volckman, Millerton, and J. W. Maloney, Newcastle, additional members of the executive.

It is understood that the larger lumbermen of the province are also considering the formation of an association, with a permanent secretary, and a committee has been appointed to report on the advisability of such an organization.

Dr. Bates Corrects False Statement

American Wood Not Stronger than Canadian—Imaginary Boundary Line Counts for Naught in Species

"American Woods Strongest." This is the heading which recently appeared in a trade newspaper across the border. The article then went on to say that tests, made by the United States Forest Products Laboratory, and by the Canadian Forest Service to determine the strength of various woods, indicated that wood from the United States is "far superior to that of Canada, Norway, Russia, etc." A quotation is then given from the Journal of the Royal Institute of British Architects from an address delivered by John R. Walker, Trade Commissioner of the United States. The National Lumber Manufacturers' Association also sent out a bulletin carrying the quotation in question.

The Journal of the Royal Institute of Architects quotes Mr. Walker as saying the following:

"Elaborate tests have been made by the United States Forest Products Laboratory, and by the Canadian Forest Service, to determine the strength of various woods, and these tests indicate that the Southern pines are from 33-1/3 per cent. to 50 per cent. stronger than Canadian and Baltic yellow pine, red pine, and spruce, and that Oregon pine is 25 per cent. stronger than these Northern woods. I have also seen the results of special tests made in this country for various purposes, which confirm the general comparisons above given. It therefore appears that while a 6 by 2 Southern pine joist dried and finished to 1 7/8 by 5 5/8 would contain 12 1/2 per cent. less cross section or cubic area than a 6 by 2 Baltic or Canadian red wood or white wood full-size joist, yet it would possess the equivalent strength of such a joist, and in fact something like 15 per cent. more strength.

"The plan which I propose is that in your building plans of the future provision be made for the use of American woods in the American standard sizes as an alternative for the Baltic woods in their standard sizes."

In a letter to the "Canada Lumberman," Dr. John S. Bates, Superintendent of the Forest Product Laboratories of Canada, Montreal, says:—"I have received the clipping which has been appearing in an American trade newspaper purporting to be an address of an abstract of a Trade Commissioner of the United States before the Royal Institute of British Architects.

"The wording of this abstract, as it stands, is certainly such as to convey a very wrong impression, especially so the title and the introductory paragraph. On looking up the text of the address in the original, ('United States Timber Supplies,' John R. Walker, United States Trade Commissioner, Journal of Royal Institute of British Architects, Feb., 1918, pp. 81-86), however, I find that no exception need be taken to Mr. Walker's statements. The paragraph quoted is the only one in his address dealing with the strength of timbers, and he nowhere makes any sweeping statement to the effect that 'wood from the United States is far superior to that of Canada, Norway, Russia or any of the Baltic countries,' as would be gathered from the first paragraph of the review in the publication in question.

"Mr. Walker's statement that Southern Pine and Oregon Pine (Douglas fir) are stronger than white pine, red pine and spruce, is true, and earlier in his address he had pointed out that Oregon pine grew in Canada as well as in the United States.

"I am enclosing a copy of a letter which we are sending to-day to the editor of the paper in regard to this matter. It is as follows:—

"There has come to our notice an insertion in the March 25th number of your trade journal, p. 31, entitled 'American Woods Strongest.' On looking up the article in Journal of the Royal Institute of British Architects (Feb., 1918, p. 81), referred to, we find the statements by the United States Trade Commissioner regarding United States and Canadian timbers are on the whole very fair. It is an isolated extract such as yours with a misleading heading which draws forth our present comment.

"The fact is that long-leaf Southern pine (not including short-leaf pine and loblolly pine) and Douglas fir (sometimes known as Oregon pine) are approximately equal in strength and are outstanding among the structural timbers in America. Douglas fir is common to Canada and the United States on the Pacific Coast. The other species inferior in strength, such as 'Canadian yellow pine' (white pine), red pine and spruce are also common to the two countries, and, of course, are just as valuable in their particular field of structural timber use. The point is that the North American wood species differ from one another in properties, but not because they happen to grow on one side or the other of an imaginary boundary line."

Lumber Company Operates Profit-Sharing Plan

W. A. McIntyre, of The Pas, Man., writes the "Canada Lumberman" as follows:—"I am enclosing a clipping from the 'Daily Northwestern,' of Oshkosh, Wisconsin. The Paine-Lumber Company are located at Oshkosh, and are the largest manufacturers in the world of sash, doors, mouldings and interior finish. I am well acquainted with the firm and have been at their immense plant several times. In years past there have been more or less labor disturbances among the woods workers in Oshkosh. Several large factories being located at that point, a good deal of this trouble was brought about through outside strike agitators. At one time the condition was serious, and I think one or two lives were lost in the rioting. This idea of the Paine Company in giving their employees a profit sharing dividend has evidently had a good effect."

The large sum of \$33,378.46 was paid to employees of the Paine Lumber Company, representing the first voluntary profit-sharing dividend given as such in Oshkosh. There have been other sums distributed among employees of manufacturing plants, but they have been designated as bonuses, while this sum was a profit-sharing payment, made in accordance with an agreement entered into a year ago, and based upon the earnings of the year 1917.

The distribution was shared in by about 900 of the 1,100 hands now employed by that company. The checks ranged in amount from \$3.95 to \$175, and the amounts were based upon the gross earnings of the individual employees. It was agreed a year ago that such action would be taken and in making up the roll, it is stated, a liberal construction was placed upon the rights of the employees by the company.

The 200 who were not included were employees who have worked for the company less than a year.

Included in the envelope containing the dividend checks was the following letter to each employee:

"We are glad to inform you that net profits earned for the year 1917 permit of declaring a profit-sharing wage dividend, as proposed by the company a year ago. In accordance with conditions mentioned at that time, we are issuing the dividend checks. In doing so, it is a pleasure to express to all employees our appreciation of the spirit of co-operation which has been apparent.

"The officers and stockholders are desirous of continuing the plan for the coming year, and invite the whole-hearted support of each and every employee, in the hope that similar dividends may be paid in the future. Cost of manufacture is the measure of profit; efficiency is the foundation of cost. Excessive speed that exhausts the individual is not necessary nor is it desired. Conscientious and thoughtful attention to duty is the first step to efficiency. Helpful suggestions to foremen and fellow workmen will advance the interests of all.

"A business enterprise operated without profit can neither pay dividends nor advance wages. We hope to do both, and with your co-operation the results are practically assured. We think it is of interest to all employees to know that the present profit-sharing wage dividend is paid in the face of the fact that all present profits are required for operating capital so urgently that no dividends will be paid stockholders for the year 1917."

The Open Boat

"When this here War is done," says Dan, "and all the fightin's through, There's some'll pal with Fritz again, as they was used to do; But **not me**," says Dan, the sailor man, "**not me**," says he; "Lord knows its nippy in an open boat on winter nights at sea."

"When the last battle's lost an' won, an' won or lost the game, There's some'll think no 'arm to drink with squareheads jus the same; But **not me**," says Dan, the sailor man, "an' if you ask me why— Lord knows its thirsty in an open boat when the water-breaker's dry."

"When all the bloomin' mines is swep' an' ships are sunk no more, There's some'll set them down to eat with Germans as before; But **not me**," says Dan, the sailor man, "**not me**, for one— Lord knows it's hungry in an open boat when the last biscuit's done."

"When peace is signed and treaties made an' trade begins again, There's some'll shake a German's hand an' never see the stain; But **not me**," says Dan, the sailor man, "**not me**, as God's on high— Lord knows it's bitter in an open boat to see your shipmates die."

—C. F. S., in "Punch."

What Trade Commissioner Service Stands For

The British Trade Commissioner Service which united the various parts of the British Empire in closer and more harmonious commercial relations with the Mother Country, is being extended. The work of these representatives during the past two years has been of such merit and influence that the number of commissioners have been increased from four to sixteen. This is the best indication of the value of the scope and character of the Trade Commissioner Service. Another evidence of the fruits of their labors is to be found in the steadily growing volume of work and in the increasing number of letters of appreciation received by the British Board of Trade and the Trade Commissioners themselves. The results of the Service have proved beyond a doubt that these representatives can be of real assistance in improving and supplementing the British traders' knowledge of the varying conditions in the Empire's markets, the openings which occur for fresh enterprises from time to time, and disappear if not accepted with promptitude, and the methods of trading most suitable for a particular area. Under the enlarged service, so far as the allocation of posts has been decided, it is proposed that four of the commissioners shall be stationed at important centres in Canada, and the others in Australia, New Zealand, South Africa, India, West Indies, Straits Settlement, etc. Mr. C. Hamilton Wickes, who has been Trade Commissioner in Canada for the past five years, rendering valuable services, will have his headquarters in the Old Country. It should be explained that an important feature of the new scheme is that the Department at home will always have the benefit and the direct assistance and advice of one or more Trade Commissioners, with practical experience in trade conditions in the Empire. Mr. G. P. Milne, late Trade Commissioner in Australia, takes up his duties in Montreal as senior Trade Commissioner in Canada, succeeding Mr. Wickes. Mr. F. W. Field, for many years editor of the "Monetary Times," Toronto, and Imperial Trade Correspondent, has been appointed one of the Trade Commissioners, with headquarters in Toronto, and has entered upon his new duties. In the near future it is expected that other appointments will be announced. The Trade Commission Service originated ten years ago, with the direct object of fostering and developing inter-Imperial Trade. The original four Commissioners had a difficult task, encountering many disappointments and setbacks, but by degrees the practical nature of their assistance and advice became known to manufacturers and traders in the United Kingdom and the Dominions, and their activities brought about gratifying growing results. Thus there have been established the importance and advantages of a Trade Commissioner Service which had its origin at the Imperial Conference of 1907, when Sir Jos. Ward, then Prime Minister of New Zealand, called attention to the need for official commercial representation of the United Kingdom in the self-governing Dominions. Lloyd George, now Premier of Great Britain, who was then president of the Board of Trade, was able to inform the Conference not long after that arrangements for the appointments for such officers were being made. The measures which were subsequently taken resulted in the institution in 1908 of the service, with four Trade Commissioners, one for Canada and Newfoundland, and one each for Australia, New Zealand, South Africa. Since then the movement has grown, and its worth and work are more widely appreciated and recognized on every side. Instead of exercising a disruptive influence on the British Empire, as predicted and hoped for by the enemy the war led to a keener realization of the strength of the ties, both moral and material, which link in one harmonious whole the scattered portions of the Empire.

Wooden Ships Being Built in Canada

A list of wooden ships now under construction in Canadian shipyards has been issued by the government at Ottawa. The ships are being built for British authorities and private interests. The list is as follows:

Canadian Vickers, Ltd., Montreal—Twenty-three drifters, 3,450, wood.

Marine Construction Company of Canada, Ltd., St. John, N.B.—One auxiliary schooner, 750, wood.

Quebec Shipbuilding and Repairing Company, St. Laurent, Quebec—Two cargo steamers, 2,600, wood.

Quinland & Robertson, Quebec, Que.—One cargo steamer, 2,700, wood.

Southern Salvage Company, Liverpool, N.S.—One cargo steamer, 2,500, wood.

Great Lakes Dredging Company, Fort William, Ont.—One cargo steamer, 1,700, wood.

Toronto Shipbuilding Company, Toronto—Two cargo steamers, 6,000, wood.

Cameron-Genoa Mills Shipbuilders, Ltd., Victoria—Four 6,500 cargo steamers, wood.

Foundation Company, Victoria—Five cargo steamers, 6,500, wood. William Lyall Shipbuilding Company, Vancouver — Six cargo steamers, 6,500, wood.

New Westminster Construction Company, New Westminster, B.C.—Four cargo steamers, 6,500, wood.

Pacific Construction Company, Port Coquitlam, B.C.—Two cargo steamers, 6,500, wood.

Western Canada Shipyards, Ltd., Vancouver—Six cargo steamers, 6,500, wood.

Chester Basin Shipbuilders, Chester Basin, N.S.—One schooner, 135, wood.

Clare Shipbuilding Company, Meteghan, N.S.—One schooner, 350, wood.

G. M. Cochrane, Fox River, N.S.—One schooner, 450, wood.

Dowling & Stoddart, Port Clyde, N.S.—One schooner, 175, wood.

Ernst Shipbuilding Company, Mahone Bay, N.S.—One schooner, 162, wood.

Falmouth Shipbuilding and Transportation Company, Windsor, N.S.—One schooner, 405, wood.

L. F. Graham, Port Greville, N.S.—One schooner, 360, wood.

W. R. Huntley, Parrsboro, N.S.—Two schooners, 620, wood.

Dr. McDonald, Meteghan, N.S.—One schooner, 544, wood.

W. C. McKay, Shelbourne, N.S.—Three schooners, 480, wood.

W. K. McKean & Co., Liverpool, N.S.—One schooner, 400, wood.

Nova Scotia Shipbuilding and Transportation Company, Liverpool, N.S.—Two schooners, 875, wood.

J. N. Rafuse, Conquerall Bank, N.S.—One schooner, 400, wood.

Robar Brothers, Dayspring, N.S.—One schooner, 140, wood.

Southern Salvage Company, Liverpool, N.S.—One schooner, 185, wood.

P. A. Theriault, Belliveau Cove, N.S.—One schooner, 399, wood.

Wagstaff & Hatfield, Port Greville, N.S.—One schooner, 400, wood.

Yarmouth Shipbuilding Company, Yarmouth, N.S.—One schooner, 175, wood.

Export of Pulpwood from New Brunswick

At the recent session of the New Brunswick Legislature a bill relating to spruce and other timber cut on crown lands was passed. Hon. E. A. Smith, Minister of Lands and Mines, in reference to the measure said that the object of the bill was to repeal that portion of the previous act which permitted an exchange of logs cut on private lands for those cut on the crown lands so far as it concerned manufacture of pulp for export from such logs. Everyone, he thought, would agree that the export of pulpwood should be discouraged as much as possible, and the law permitting the exchange of logs opened a door by means of which many violations of the act were being carried out. At the time the bill which prohibited the export of pulpwood cut on crown lands was passed it was generally conceded that it was a very wise measure. The idea of that act was that by prohibiting the export of pulpwood that industry might be fostered in New Brunswick and the pulp manufactured there, instead of the raw material being shipped abroad and the people of the province consequently robbed of considerable profits which they might otherwise receive. Pulp could be manufactured in the province just as well as in the United States. There are several pulp mills in the province. In particular, he would mention the one at Newcastle. The trouble with that mill, however, was it had no timber limits, but depended entirely upon what pulpwood could be got from private lands. The Fraser Company was just about completing a large pulp mill, at a cost of about a million and a half of money. The province must get all the manufactures it can, and not send them abroad, where foreigners got the benefit of New Brunswick raw material and the people of the province lost all benefit from it. A delegation had recently interviewed him with a view of having the mill waste and the tops of trees that were used for making pulp allowed to be exported, but all tops up to four inches diameter could be put through the mill, and he was informed that only about 12 per cent. of the wood put through mills was above eight inches. He thought it would be unwise to allow even the tops to be exported, but he was not so particular about the mill waste. He was willing to allow the act not to come into force till May, 1919, which would give people who had a lot of pulpwood piled up already a chance to export it.

A motion to allow the export of mill waste was, however, lost.

Considerable Work Ahead in Cruising

Mr. James W. Sewall, of Old Town, Maine, has just returned home from a short cruising trip in the Adirondacks. While several of his best men are in the service, both in America and in France, he reports that he will be able to take care of his clients, old and new, this year. In 1917 this concern cruised in the neighborhood of 2,000,000 acres of timberlands, and, while 1918 does not open up as anywhere near so heavy a season, still considerable work is being booked, which shows that the land market is not entirely quiescent.

Salesmanship from Several View Points

Study the Needs of Consumers in Most Available Markets—Importance of Having Complete Knowledge of Grades, Texture and Strength of Stock

At a recent salesmanship conference an interesting series of brief addresses upon salesmanship from various points of view was delivered by several speakers. The addresses included the following:—

The Industrial Consumer's Viewpoint, by S. S. Stewart.—How can the salesman and the buyer so co-operate that the producer shall receive the highest possible legitimate return for his lumber and the consumer get the lowest possible price consistent with satisfactory grades? Primarily, of course, the buyer should know well in advance what his requirements will be, and the salesman should be so well grounded in the detail of grades and methods of manufacture that he can study the buyer's requirements intelligently, continually searching for substitute grades or woods, which will meet with the buyer's requirements and still answer the question, for the salesman who can suggest a substitute of this kind establishes a personal reputation, which, when reinforced by the shipping of consistent grades by the producer, is a mighty valuable asset to both, other conditions, of course, being equal.

Just a word regarding the substituting of woods. I clearly recollect that in the early days of the supremacy of the carriage building industry, yellow poplar was considered to be the only satisfactory wood for buggy body panels, and white ash was the real thing for sills; then, as the demand grew and cost of production increased, the need of a substitute became pressing, and cottonwood was used for panels, together with maple for sills on the cheaper work, and finally gum was used in place of cottonwood to a large extent. Similar conditions obtained to a considerable degree later in the manufacture of automobile bodies, substituting birch for ash, then maple for birch, and at present large quantities of gum are being used for parts formerly made of maple and elm. The poplar, of course, we all remember, was replaced by steel, this substitution being hastened by the shortsightedness of the poplar people, who unwisely accelerated the already rapid development of the composite steel and wood body by the prohibitive price which they placed on their product. It might perhaps be prudent for the lumber producers and dealers to bear this instance in mind when determining prices, as it is common knowledge that the "goose which lays the golden egg" will stand only a certain amount of grief.

I recently asked a buyer of large quantities of lumber what he considered was the greatest fault to be found with lumber salesmen as a whole, or rather, what was the chief criticism he would offer in relation to the ability of lumber salesmen, and his reply was short and to the point, namely: "They don't know their stocks." When we consider the application of this brief sentence, we can readily see that it contains a lot of meat. The buyer depends almost entirely on what the salesman tells him regarding the various stocks of the producer; therefore, it is of the utmost importance that in addition to being able to go to the absolute limit as to price, the salesman should be fully posted as to the grades, texture, general and individual characteristics, including ranges of strength and kiln drying properties of the producer's stock, as well as to be in a position to give full information regarding the car and rail conditions which may affect the delivery of the product.

The Salesman's Viewpoint, by Enos Colburn.—There are a few general rules which I believe all manufacturers and sales managers should set down for their salesmen to follow: First—Tell the true condition of his stock, even if he does not make a sale. Second—That the salesman should be cautioned never to knock his competitor's products. Disparaging remarks about his competitors' products and the officials of the competing company always leave a disagreeable feeling in the dealer's mind. In my experience I have seen a new salesman rush into the office and out again, his idea being to see how many towns he could cover in a day. Again, I have seen another salesman come in, take a look around and sell to his customer the very same day that the first traveling man came in and left. The idea of the first man was to see how many towns he could cover, and the idea of the second man was to see how much lumber he could sell. I think, if it were carefully figured out, you would find that many of your salesmen are constantly running away from business in order to cover the territory given instead of soliciting orders which they had in their hands. You may take, as an example, the successful commission salesman. He generally confines himself to a small territory and endeavors to work the territory well. He is not trying to make territory or see how many stops he can make; he is to sell lumber.

Too frequently I have seen sales managers fail to give good salesmen co-operation from the home office. Misunderstandings arise occasionally and a manager sometimes attempts to settle a dispute without asking his salesman for his opinion. The result is that the sales manager attempts to handle something with which he is entirely unfamiliar, and often friendly relations between the salesman and the dealer are broken.

There is no question but that the salesman's efficiency can be much increased, if he enjoys the confidence of the sales manager and at the same time is informed regarding all points covered under the observation of the sales manager, with reference to the market conditions, etc. I do not know positively, but I have always surmised that the sales managers are often careless along that line, with the result that good orders slip away from their salesmen. The point I want to bring out is that the salesman ought to be wise enough to take advantage of the rising market and at the same time have authority to meet conditions that exist on the falling market. To do this, of course, it is important that a salesman should be able to recognize the difference between a falling market and cut prices. Right here is where the sales managers should count.

The Manufacturer's Viewpoint, by C. A. Goodman.—A manufacturer of lumber is engaged in the business of selling stumpage. His viewpoint should be that of a salesman. That the ultimate returns for his work and investment should pay him a profit is the point he should keep in view with each successive stage in the manufacture of his product.

The units of production in the lumber industry are small and scattered and each different from the other as to conditions of operation and character of output. Lumbering is pioneering. The lumberman goes into the forests more or less remote from the centers of business activity. There he struggles with the many problems of getting his logs to the mill and sawing them into lumber. The beginning of each of these operations has usually been due to the enterprise and ability of small groups of men and perhaps of only one individual.

The nature of the conditions under which they operated made it necessary that all of the energies of these men be extended in production. Only a few years ago the lumbermen considered that when they had put the lumber into pile their work was finished. What they would get for their lumber was largely looked at as being outside of their own control and they had no other idea of what prices they should obtain than to accept the highest prices which someone came along and offered them. If these prices thus obtained were not sufficient to pay them a profit, then they took a loss and hoped for better times the next year. The very nature of the work required of these pioneer lumber manufacturers was incompatible with the details of distributing lumber to the best advantage. Many of these men were first-class loggers, but understood very little even of sawing and putting their lumber into pile and a great many of them nothing at all of the various grades. Good logs were often sawed into poor lumber. The grades were mixed in the piles and shipment was made largely on the buyer's inspection. These conditions have not entirely disappeared.

This is one of the reasons for the failure of so many small mills. The operators were not salesmen. Their logs were often worth more before they were sawed into lumber than the product afterwards.

What must a manufacturer do to sell his stumpage to the best advantage? First, of course, he must manufacture his lumber right, then he must sell it right and ship it right. Manufacturing means all of the details of cutting the logs in the woods, sawing the lumber, sorting into various grades and piling and properly caring for until time of shipment.

In order to intelligently supervise the manufacture of his stumpage the manufacturer should, first of all, have some knowledge of the requirements to which his product, if properly manufactured, may conform.

Each manufacturer of hardwood lumber should study the needs of the consumers in his most available markets. When he knows who uses the various grades and thicknesses of such hardwoods as he manufactures, then a further study of the size and quality of his own timber would enable him to decide what class of material can be produced from his logs to the best advantage. Putting lumber into

pile without any object in view, except to see how much the mill can cut, is wrong.

There should be an attempt made to forecast the market. If it is known what lumber is to be used for, then some attempt can be made to saw the logs to meet the needs of the consumers.

Many of our Northern mills do not manufacture enough lumber to enable them to sort up their stocks for distribution direct to the trade. Some mills who do manufacture in large quantities prefer not to maintain a selling organization of their own, but to sell all or part of their cut to wholesalers. In this case, if these manufacturers secure a price that leaves the wholesalers only a reasonable profit, then they are getting the most they can expect. Selling the lumber to the ultimate consumer, making shipments and deliveries and collecting the accounts, are just as much a part of the lumber business as getting out the logs and taking them to the mill and sawing them into lumber. If a manufacturer wishes to entirely delegate the selling of his lumber to someone else, then he should expect that they would make a proportionate part of the total profit. These two interests, the manufacturers and wholesalers, ought to work in harmony. They both have the same object. Each wants to get all he can for what he has to sell.

Who, then, cuts the price of lumber, and why? We have succeeded in standardizing the grades of lumber but not the prices. Standardizing prices does not mean that prices may not vary following the law of supply and demand, but with better information of conditions prices made by different dealers at the same time should approach some degree of uniformity.

The Stabilizing of Prices

It is difficult to stabilize prices unless the prices are known. Everyone talks about hemlock prices, and we all know what hemlock is being sold at, but very few real honest comparisons are made amongst dealers as to prices they are getting for hardwood. I do not think the hardwood manufacturers have gained by the policy of secrecy as to sales. Shrewd buyers for large corporations and consumers have taken advantage of this; in fact, we have been easy. Each purchase they make of some special article will be accompanied by the confidential information that the price being paid to this particular mill is very much higher than this same concern is paying to anyone else. A year or so ago, an implement concern went through Wisconsin making contracts for certain sizes in maple. It was almost impossible to find out who was cutting any of this material, because each mill thought they had a snap. Finally, it developed that our company was getting \$9.00 more than a neighbor, which made us feel good until we found a concern over in central Wisconsin was getting \$17 more per thousand than we were. It is only recently since we have had our sales managers' committee that any attempt has been made to figure out what this stock is really worth, and we then found all our prices had been much below cost.

Hemlock has demonstrated that co-operation is better than individual effort in selling lumber as in everything else. We should have this same co-operative spirit in hardwood. Our sales managers' meetings have done a great deal of good, but so far they have not created sufficient confidence in the market to prevent unwarranted slashing of prices.

There is no better way to prevent the selling of any article for less than cost than to have the producer of the article know the actual cost of production. Lumber seems to have been about the only commodity which has been sold without any regard to cost. The manufacturers of yellow pine have recently gotten up a statement of the average cost of yellow pine at the average mill figuring the fair present value of stumpage. They have really found it necessary to do this because the government is buying large amounts of lumber and the government price is based on allowing a fair profit above cost.

It is bad policy to be in too much of a hurry to sell your lumber. Do not try to force it onto your customers before they want it, as that only makes them think that there is a surplus of the very items they are using. Everything that you make in the way of lumber will be needed if you are satisfied to let it wait its turn, and in the meantime make some intelligent effort to find out who will probably use it, when they will need it and what it is worth.

The only remedies I can see, therefore, for the present conditions confronting the manufacturers and wholesalers in the hardwood trade are: First, to know what his stock costs; second, a careful study of stock sheets and co-operation with other dealers in the handling of surplus items; third, keep your heads cool and your feet warm and do not be in too big a hurry to manufacture lumber in excess of the demand or to push it onto the trade before it is needed.

The Wholesaler's Viewpoint, by E. M. Holland.—It is only fair to start you off right by stating to you a pretty generally recognized fact, namely, that the first-class wholesaler is the industry's greatest salesman. I do not believe that there is one of you who doubts this. Ninety or more times out of a hundred wholesalers are made up of

the graduates from the manufacturing end of the business. The most successful wholesale lumbermen I have had the privilege of meeting have gone through every phase of the lumber business, from woodsmen to sales managers and oftentimes, general managers.

A great many also are connected directly or indirectly with the manufacture as well as the sale of lumber. Furthermore, the successful wholesaler must know the manufacturing end of the business before he can properly market the product. Many times in my short experience, I have had the good fortune to meet some of the old timers, those who have made history in lumber manufacturing and they have said to me: "Why, he used to work for me in the woods, worked all the way up to head salesman—decided to shift for himself, is making good."

The average manufacturer of today and in the past will try out every idea or scheme from canthooks to steam loaders, from hand-made tram carts to electric trolley piling systems, circular saw to tandem saw, from wood chopper to general manager to save 10c per thousand feet or more on the cost of production and then throw away all this saving and "then some" for the most miserable system of marketing you ever heard of.

The average sales department has been considered a necessary evil, sort of department created for the movement of lumber and has usually been paid about one-half of what should have been paid for an efficient sales department. Small salaries have been in vogue ever since this necessary evil was created, and have affected every one in that department from the sales manager down.

It has always been the custom to market lumber at the lowest possible cost, whereas liberal expenditures of money have been made to secure production efficiency. The sales managers of today and in the past have been tied down to their desks with oodles of detail, so I can safely say that not one in a hundred knows his customers personally, and if he does, nine times out of ten the customers have found him in his own home town.

Why, gentlemen, it is only recently that you began to mix with your brother sales managers in the same line of business. How are you going to succeed and grow if you are allowed to get stale sitting around home 90 per cent. or more of the time? Bear in mind one important thing, your customers like to look you straight in the eye now and then.

Another point is, that the amount of money paid to sales forces keep them from being stars, and if by chance a star is developed, it is next to impossible to secure compensation commensurate with services rendered. The average sales manager will generally sour, go to seed or breaks into the wholesale lumber business.

Good Pay and Good Sales Managers

If there is any doubt in your mind as to what I have said, let me give you a little one on a manufacturer who is rated AAAA-1, a really large operator. This concern paid their sales manager the munificent sum of \$1,800 per year, and their traveling representatives from \$1,000 to \$1,500. This company manufactured about a hundred million feet of lumber annually and they expected to dispose of it at top notch prices. Their only advertising was a two-color price list sent broadcast with not a foot of lumber listed thereon. The only way you could find out what they had on hand was to jump on the train and look over the stock in their yards.

I positively know that this sales manager had not been outside of his home town an average of four weeks out of the entire year, conventions and vacations included. You may ask how I know all this? Why, the sales manager told me himself. He stated he had reached the limit of salary his company would pay. He wanted me to exert my efforts to place him with some live wholesale concern where they would give him an opportunity.

He also stated that his traveling salesmen were recruited from high school and college graduates with about a month or two's experience in the mill and yard. He also stated that when they started on the road they did not know as much about lumber as he did about sailing the high seas and he claimed he did not know the star-board from the port side of the vessel.

A while ago a representative of one of the large manufacturing concerns in the West called at my office to sell me some boards. His price was about \$3 per thousand higher than a similar kind of material produced in our section of the country. I advised him that his price was considerably higher and asked him why I should pay a premium for his stock. He replied by saying that it was pretty hard for him to sell his stock in this territory as his price was so much higher than his competitors', and he could think of no reason for his condition excepting that the freight rates were so high. Gentlemen, he did not know his grades were nearly \$5 per thousand higher in quality than the stock from our own section of the country.

The few instances I have related to you apply only to the large

operators who maintain sales forces. There are other instances I could relate, but I have given you some real important ones.

The other manufacturers who do not maintain sales forces sell their product during their leisure hours or when the spirit moves, generally paying very little attention to the selling or to whom sold as long as the lumber was moved to make room for some more lumber to be cut and so on until all the trees are gone.

On Knowing What One Has in Stock

Gentlemen, in most cases it is almost impossible to get a description of stock. The men who manufacture the lumber generally ask their customers to come and look it over. They do not know themselves what they have in pile, how it will grade, average widths and lengths, etc., yet they expect their customers to look at the outside of the piles and figure it out for themselves.

I could go on indefinitely finding fault with the other fellow, but haven't I given you some reason why the wholesaler should exist?

The average first-class wholesaler has adequate capital to discount his bills. They are the kind that sell the product for just what it is and you can depend upon them to get the highest market prices, and deliver the goods. When I say deliver the goods, I mean a great deal. It applies to delivering to the manufacturer of the said goods, as well as to the ultimate consumer. You will find the relations existing between the first-class wholesaler, manufacturer and consumer are generally very pleasant. Those of you who cater to both the wholesale and consuming trade can count on the highest type of competition.

In the past we have done very little to educate the industrial consumer and on top of this we have made it harder by continually changing the inspection rules. Do not misunderstand me. The changes in the rules were absolutely necessary, yet they could not help but make it harder for the consumer to keep up with the procession. Therefore, his lumber buying is placed on the plane of price only, the only buying guide handed out to him.

Many manufacturers have been discouraged with this condition and have made very little headway in improving same. To sum up what has been done, I think I hit the nail on the head when I say that they have gone into their manufacturers' meeting yelling, "Down with the wholesaler," without adopting some means as mentioned before, of separating the sheep from the goats.

Educating the consumers in a nice, diplomatic way represents also another solution of the problem. Those of you who sell direct to the consumers can do a whole lot more toward educating them than has been done in the past.

Should Sell Pulpwood to Canadian Mills

G. C. Piche, Quebec, P.Q.

In his annual report on the Quebec Forestry Service, Gustave C. Piche deals with the high prices for pulpwood in the province. "Sales are said to have been made," he remarks, "at from \$12 to \$15 per cord, and even more. One can get an idea of the scarcity of wood from the fact that buyers came from the State of Wisconsin and had to transport the wood they bought over 800 miles, which must have made the cost price heavy." The province, he proceeds, continues to produce far more than one-half of the total production of pulpwood in Canada, and he notes that the export of manufactured pulp is showing a progressive percentage of increase over pulpwood. He proceeds:

"Since 1910, the date when the order was passed compelling the

manufacture in Canada of all wood cut on crown lands, Canada exported a total of 6,800,407 cords of pulpwood. As this wood comes entirely from private lots, there has been a considerable drain on the forest resources of private individuals. Taking 10 cords as the average yield of pulpwood per acre, this would represent cutting over an area of 680,400 acres, or 1,062 square miles. The share of our province for the same period would mean a cut of 5,085,780 cords on an area of about 508,578 acres, or 794 square miles."

This wood largely comes from settlers' clearing and farm lots, and he strongly advises such private owners of wood to sell to Canadian mills instead of exporting it, saying that if they did this, then, "instead of getting an average value of \$7.40 per cord, we would, by transforming the wood into mechanical pulp, the prices would vary between \$40

and \$90; for news print they would run from \$40 to \$60 per ton. It is true that this increase is largely due to the cost of certain materials, of the more expensive plant needed for these transformations, but the amounts paid in wages are yet considerable, and represent a rather large proportion of the above figures."

He adds that the increasing demand for pulpwood "allows us to hope that the immense territories of Labrador, Ungava, and the North Shore, so rich in pulpwood and so poor in large timber, will thus acquire value. As all the world's forests are becoming more and more exhausted and no substitute for wood has yet been found, it follows that other countries will have to rely more on our province for the pulp and paper they need. It will be easy for us to supply them if we take our precautions, for we have the raw material and also the necessary water-powers."

Believes in Being On the Job

"By taking off my coat and looking after what came in hand and attending to every order in the best manner that I knew how, I have met with fairly good success in the retail lumber business," said James A. Matthews, of Orangeville, Ont., who manufactures doors, sash and builders' supplies and makes a specialty of custom dressing.

His plant is located at the corner of Mill and Church Streets, and, while not large, is well equipped. Mr. Matthews has a fair-sized lumber shed, 75 x 170 feet, and keeps most of his stock under cover. He is a practical man, and has been in business in the capital of Dufferin County for the past fourteen years.

Previous to launching out for himself he was employed by D. McDonald, of Orangeville, as foreman in the factory, and prior to that period worked for a couple of years in Parkdale. Mr. Matthews belongs to the Ontario Retail Lumber Dealers' Association, and believes that much good work will be accomplished through that organization.

J. A. Matthews, Orangeville, Ont.

Just Twenty-one Years in Business

The proprietor of the Wingham Planing Mills, Wingham, Ont., is Samuel Bennett, who has been in business in that town just twenty-one years. He purchased the plant of J. Wall & Son in 1897, and three years later pulled down the old mill and erected a new brick building, equipping it with modern machinery.

Mr. Bennett makes all kinds of house finish, doors, sash and other lines, and has met with considerable success in his enterprise. He was employed for a number of years with John Browdford, in Seaford, and in 1887 entered into partnership in a planing mill business in the same town with Noble Scott, remaining with him for ten years. He then disposed of his interest to Mr. Scott and his sons, and located in Wingham. Mr. Bennett believes in organization, and is a member of the Ontario Retail Lumber Dealers' Association. He is of the opinion that there are many important matters which that body can take up and exert a splendid benefit upon the trade in general.

Samuel Bennett, Wingham, Ont.

The Board of Railway Commissioners has issued the following new rule on car demurrage: "Delays beyond free periods allowed for any two or more purposes under this rule shall be aggregated and charged for in accordance with Rule 9 unless re-consignment effects actual transfer of ownership of goods, in which case the charge against the new consignee for delay beyond the free unloading period shall begin with the lowest toll."

Making Foreigners Good Citizens

What the Reading Camp Association Undertakes and Has Accomplished During Last Eighteen Years

Alfred Fitzpatrick, Toronto

Instruction work has been carried on in the lumbering, mining, and railroad camps of Canada through the Reading Camp Association for eighteen years. In the days before the war, when the Western branches of the C.N.R. and various lines of the C.P.R. and G.T.P. were being built, as many as 72 instructors were employed, but of late, owing to fewer camps, the number of men who teach the foreigner the rudiments of the English language has been considerably less. The instructors work with pick or shovel, saw or axe, during the day and at night impart knowledge and see that the men are entertained by singing, music, pictorial publications, etc. Twenty-nine instructors were engaged last year, and of several enlisted, five were killed in action. Mr. Alfred Fitzpatrick is the pioneer and superintendent of the work of the Reading Camp Association, which, contrary to general opinion, does not undertake religious instruction by creed, but by example. It lays the foundation work in the shape of inducing the foreigner and the illiterate to read and write, and thus assist in equipping them to become good citizens. The association believes that there is not a great deal to be gained by talking to men about the higher life until they are first able to understand the English language and learn something of the duties and privileges of Canadian citizenship and the British form of government, as well as the freedom, toleration, and protection enjoyed under the institutions of the Dominion.

The annual meeting of the Camp Association was held recently at the head office, 67 Yonge Street, Toronto, and a satisfactory financial statement was presented. The contributions for last year amounted to \$16,185, which is \$700 more than in 1916. The report of the office secretary showed much good work had been accomplished in the way of supplying the camp with magazines. Forty camps are supplied, and where there is an instructor a parcel is sent every week. One gratifying statement was that the association is virtually out of debt and has a clean record to begin the year. Several women have been elected directors which is a new move on the part of the executive. Several amendments to the constitution were adopted, and Mr. Fitzpatrick, superintendent, gave an interesting report, in which he pointed out that the object of the association is to bridge over the gulf between the frontier toiler and the university man, and the reason why the meeting was held in the business section of the city instead of the university, as formerly, was because there the association is better able to keep in touch with the business man.

The aim of the association has been to demonstrate to the public in general and the provincial governments in particular that camp education is both practicable and desirable, and the association urges the provincial governments to take over the work when they are able to extend their systems of education to embrace the needs of the frontiersmen. These governments have shown their interest in the organization by giving grants as follows: Ontario, \$2,000; Quebec, \$300; Manitoba, \$500; Nova Scotia, \$150; Alberta, \$300; Saskatchewan, \$200; British Columbia, \$300; New Brunswick, \$100.

Mr. Fitzpatrick said that it was gratifying that Ontario had adopted a plan of camp homesteading which he had outlined in 1915, and gratifying also to know that study classes had been organized in the trenches under the name of Vimy Ridge University, similar to that initiated by the Reading Camp Association in Canada and the United States.

In Canada 95 per cent. of all construction work is done by the foreigner and 50 per cent. of the work of lumber camps, so the problem is mainly that of the foreigner, and night classes are more than ever necessary if the alien is to be Canadianized and made a useful citizen.

Mr. Fitzpatrick spoke in terms of high praise of the work of the instructors, who use the axe, pick, and shovel by day and in the evening gather the men together for instruction in the reading room, and make their lives bright by singing and music.

William Leak, formerly of Leak & Co., Toronto, returned recently, after spending the winter in Florida.

Trade Associations and the War

WAR is teaching both business and government some long neglected lessons. Supply and demand, in time of peace, have frequently seemed indefinite and remote; something that business could overcome by co-operation, and something that government could legislate out of existence. The United States Fuel Administration, however, beginning with its fixing of soft coal prices last summer, ending with its shut-down order last January, conclusively proved that supply and demand, like the wind and the tide, are elemental, irresistible forces transcending the powers both of business men and government officials.

Co-operation, in time of peace, has sometimes seemed a kind of business magic; to the business man something that saved him from himself, by putting prices high enough to take care of his wastes; to the government something that mulcted consumers with unwarranted and exorbitant prices. That is why the government, notwithstanding all its praise of trade associations, has vigorously prosecuted scores of them, and even at the present time is proceeding against nearly a dozen more. That is why the Supreme Court has denounced several associations in the lumber trade. That is why the lower federal courts have fined officers of trade associations of plumbers, paper manufacturers, coal dealers, wire manufacturers, produce dealers, monument dealers, commission merchants, machinery manufacturers, and potato growers. That is why the Department of Justice, within the last few months, has taken consent decrees from trade associations to the honest belief of their members, have comprised only exchange of information regarding production, stock on hand and the state of demand.

"What an absurdity it is to find the very co-operation which the nation finds necessary for its own economic salvation under the strain of war is denounced as a crime in time of peace! Let our legislators free our statute books of cant. Let us give honest business, fair and reasonable organization, whether of business or of labor, a broad field and permit the enjoyment of the essential conditions of efficiency in the coming days of peace in the interest of the common prosperity.

"May we hope that through this war we may learn how to regulate and not destroy, how to open the door to American enterprise here and abroad under rules of public protection which can be known in advance and which reason can approve. We cannot tell what the present necessary action with regard to the railroads may portend. But may we not expect that we shall at least have a conserving and up-building policy which will recognize that there is no adequate protection to the public interest which does not foster the instrumentalities of commerce. I do not look to the period after the war with an undue optimism. I think that our real progress will still be slow. But I do expect better adjustment of legislation to the facts of life."

To this "better judgment," not only of legislation, but also of public opinion, and of business itself, to the "facts of life," let the trade associations of this country now address themselves.—G. H. Montague, before Hardwood Manufacturers' Association.

Human Carelessness Aids Fire Fiend

That man is at least three times as destructive as nature, at least so far as forest fires are concerned, is revealed in a compilation which has just been issued by the Federal Forest Service. The figures of this agency show that of 7,814 forest fires on government lands during 1917, all but 2,132 were caused by human agencies.

Over 962,000 acres of timber in the United States forage and young growth to the value of \$1,358,600 was destroyed. This loss, while larger than those of the past few years, is considered remarkably light in view of the unusually dangerous conditions which, owing to protracted drought and periods of high winds, were practically the same as in 1910, when many persons were burned to death and \$25,000,000 worth of timber on the National Forests was destroyed. It is estimated that in addition to the actual loss in timber, etc., \$1,121,451 was spent by the government for the purpose of fire fighting and prevention.

Brigadier MacDougall, of the Canadian Forestry Corps, has been made a Commander of the Legion of Honour by the French Government.

Owing to the fact that little rain has fallen and the snow has melted away gradually in the sun's warm rays, lumbermen in Northern Ontario are meeting with great difficulty in taking out their winter's cut. In a number of cases, unless exceptionally heavy rain comes within a few days, it will be impossible to get the timber out. Already the high lands in the forest are free of snow, and that remaining in the valleys is disappearing rapidly. The rivers and lakes are all open, in most cases from eight days to three weeks ahead of former years, and to date the movement of the timber from the bush has hardly commenced.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Basswood Wanted

Highest cash price paid for log run basswood and mill culls. Also other hardwoods of all kinds. Address Box 712, Canada Lumberman, Toronto. 7-10

Trimmer Ends Wanted

White Pine, Red Pine and Spruce, 1917 or 1918 cut. Write stating approximately what you have. Give thickness, conditions as to color, worms, etc. Box 738, Canada Lumberman, Toronto, Ont. 10-15

WANTED

Spruce Squares and Lumber

Several cars Clear and No. 1 Eastern White Spruce Squares, any size, 4 x 4 to 6 x 6 or over, 4 ft. and longer; can be shipped green from saw. Also several cars 5/4-in. or 1 1/4-in. quarter sawn; also 5/4-in. Clear and No. 1, plain sawn, Spruce Squares and Lumber. Box 735, Canada Lumberman, Toronto, Ont. 9-12

Wanted-Basket Bottoms

Ten cars of Basket Bottoms in spruce, pine or other suitable soft woods in the following sizes:

16 1/4 in. x 6-7/8 in. x 7/16 in.
13 1/2 in. x 5-7/8 in. x 7/16 in.

If unable to supply as above, 1 inch re-sawn lumber in 6-inch and 7-inch widths will answer. A good grade of cull lumber will answer, but must be clear at the edges.

CANADA WOOD PRODUCTS CO.,

8-11 St. Thomas, Ont.

For Sale-Lumber

Piling

We are operating in the woods this Summer and can supply piling any size and length. Enquiries solicited.

Knight Bros. & McKinnon, Limited,
10-13 Box 569, Cobalt, Ont.

Piling For Sale

We are in a position to supply Piling of all lengths and diameters, cut to order, in reasonable time. Write to us for prices.

DON H. JACOBI & CO.,
8-11 Haileybury, Ont.

Lumber For Sale

Two cars 4 x 4 Maple Boxed Hearts.
One car 5 x 5 Maple Boxed Hearts.
One car 6 x 6 Maple Boxed Hearts.
Seven cars Fir Doors.
Three cars Fir Columns.

GEO. C. GOODFELLOW,

Montreal, Que.

Lumber For Sale

Cut of four million feet of Spruce, mill run. Suitable for most any purposes. For particulars apply to Quebec Lumber Company, 81 St. Peter Street, Quebec, Canada. 8-11

Lumber For Sale

For delivery during coming summer, we offer 1,000,000 feet superior quality mill run Jack Pine. Also 200,000 feet mill run Spruce. For further particulars address

The International Land & Lumber Co., Ltd.,
283-285 Bank Street,
9-10 Ottawa, Ont.

White Oak Hearts

We will be sawing a quantity of White Oak that would furnish squared hearts, 4 in. x 4 in., 8 feet long.

Address enquiries to Niagara & Erie Land Corporation, Lynedoch, Ontario. 7-10

For Sale-Machinery

Steel Rails For Sale

A small quantity of 20 lb. light re-laying rails, for sale for immediate delivery. Apply Box 651, Canada Lumberman, Toronto. 7-t.f.

Boom Chains For Sale

300 to 400, mostly 5/8 inch, good second-hand Boom chains.

Quincy Adams Lumber Co., Limited,
10-11 Longford Mills, Ont.

Belting For Sale

We have a large quantity of Second-Hand Rubber and Leather Belting in all sizes and plys up to 24 inches in width, which we can sell at interesting prices. Send us your requirements. N. Smith, 138 York Street, Toronto, Ont. 9-11

Machinery For Sale

1-Jenckes Machine Co. 40 H.P. Boiler on skids, with stack, spark arrester and engine connections.

1-10 x 12 center crank engine.
1-3 saw edger and saws.
1-18 ft. 2-saw trimmer and saws.
1-2-block carriage, set works, track and rope feed.

1-Husk arbor, etc.
1-Bull wheel, shafting, etc.
1-Cut off saw and arbor.
1-Covel No. 35 automatic saw gummer.
1-Lumber car, track, miscellaneous shafting, belting, pulleys, etc.
1-Complete blacksmith outfit and two chests of tools.

All for sale, F.O.B. boat or cars Sault Ste. Marie, Ont. Will sell in block or separate items.

Address for further information: -

SHELBY BASKET COMPANY,
10-1f Shelby, Mich.

Logging Trucks Wanted

WANTED—Several sets of heavy logging trucks in good condition. Wire, Trenton Cooperae Mills, Ltd., Trenton, Ont. 9-10

Wanted-Employment

Advertisements under this heading one cent-a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

A1 BAND SAW FILER, Double or Single cut. Twenty years' experience in large saw-mills. Reference. Box 727, Canada Lumberman, Toronto, Ont. 9-11

POSITION WANTED AS WOODS MAN-AGER or Cruiser for Lumber firm by experienced party capable of taking full charge if required. Have made good. Satisfactory references. Apply Box 725, Canada Lumberman, Toronto. 8-10

EXPERIENCED LUMBERMAN, married, wants position as manager. Still employed. Superintended lumber cut, estimate and shipment. Reason for change, company not doing further business. Reference given. Box 662, Canada Lumberman, Toronto, Ont. 2-10

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

Wanted

First class pile driver operator accustomed to Railway construction work, must speak French; immediate.

FINCH, PRUYN & CO., INC.,
10-10 Henry River, P.Q.

Wanted

Salesman calling on the lumber trade to handle a well-known side line, used by all lumber companies. Liberal commission.

P. M. Co., No. 5 Bruce Ave.,
10-12 Windsor, Ontario.

ACCOUNTANT—A FIRST-CLASS OPPORTUNITY for the right man is open in the Logging Department of a large paper company for an accountant. He must write and read both languages. One who has had previous experience in this line of work is preferred. Box 728, Canada Lumberman, Toronto, Ont. 9-10

LARGE QUEBEC MANUFACTURING CONCERN requires services of first class lumber shipper. Must be able to keep force of six or eight checkers and inventory men going, also be familiar with planing mill operation. Must be fast and accurate at figures and a good penman. Send references in first letter to Box 729, Canada Lumberman, Toronto. 9-10

Wanted immediately, good accountant for confidential position in lumber business. Give full particulars, age, photo, experience, salary expected and when ready to commence, in first letter. Apply Box 736, Canada Lumberman, Toronto. 10-10

Business Chances

WANTED Pulpwood Limits

Responsible parties wish to purchase pulpwood limits, large and small, with and without water power. Apply, giving all possible particulars, to Box 737, Canada Lumberman, Toronto. 10-10

Canadian Hardwood Timber Limit

I can secure an option for a good, responsible firm on a tract of Hardwood in Parry Sound District which it is estimated will cut 20,000,000 feet b.m., of Birch, Maple and Hemlock, and 60,000 cords of Hardwoods. The birch is of the finest quality of large timber in Canada. Limit only short haul from railroad. Full particulars furnished to interested parties. Box 732, Canada Lumberman, Toronto. 9-10

For Sale

Water power sawmill and site at Magneta-wan, in good running order; capacity about 12,000 feet per day; also timber and wood on 400 acres on river front near mill; good piling grounds and shipping facilities; well established business and good reasons for selling.

The Fred Taylor Lumber Company,
7-10 Hamilton, Ont.

FOR SALE Hardwood Limit

Large area—convenient to transportation. Low freight rate—good labor market—convenient to Toronto. Large quantity Birch and Maple. For particulars write to Box 716, Canada Lumberman, Toronto. 8-11

Timber Limits For Sale

FOR SALE—The actual owners wish to get into touch with actual buyers. Virgin timber; average 27 M. to the acre; on a river; close to tire water; inside Vancouver Island. Fir, spruce, yellow cedar, red cedar, Coast hemlock, balsam. Exceptionally good logging. Held under perpetual licenses. Price on basis of one dollar per M. Address: The Sunset Mills, Limited, Nelson, British Columbia. 6-10

Saw Mill For Sale

Sawmill for sale, including two large engines and three boilers, steam feed carriage, gang edger, steel burner, lath mill, etc. Shingle mill equipped with four automatic machines. Box 734, Canada Lumberman, Toronto, Ont. 9-12

Spruce Limit Wanted

IF YOU HAVE A GOOD, GENUINE PROPOSITION in the Lumber line, please communicate with me. Will entertain the purchase of good spruce limit with or without mill plant, situated preferably on an easy freight rate to Montreal, or will consider financing the exploitation of good timber limit. No cut-over lands will be considered. Reply full particulars, P. O. Box 284, Montreal, Que. S-12

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood. New Watrous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
Montreal, Que.

S-t.f.

More Tributes Paid to Canadian Foresters

In late issues of the "Canada Lumberman" appreciative references have been made to the worth and work of the Canadian forest corps. There appears to have been only one shortcoming in these battalions, and that is the overmanning of the staff. With each corps that went overseas there was the usual complement of officers, but on their arrival in England a reorganization was made under the authority of Sir Edward Kemp, Minister of Overseas Military Forces of Canada, and, as happened in regard to the infantry battalions, a surplus of officers resulted. Many of the forestry officers have been given an opportunity to go to France to join the combatant forces, and have availed themselves of this privilege. They are now members of the regular fighting units. It appears that a number of officers were naturally more conversant with military tactics and discipline than they were with cutting down trees or lumbering operations. The rank and file, however, know all about such work, and their achievements still continue to invite the plaudits of those higher up. This is evidenced by a letter which was received recently by Sir Robert Borden, Premier, from Sir Edward Kemp, containing a copy of a communication from Brigadier-General Alexander McDougall, director-general of timber operations, who pays the following tribute to the men:

"I wish to draw your attention to their general good behavior and the deep resentment that we feel against the slanderous attacks levelled at the men of the Canadian overseas forces in certain quarters in Canada.

"When it is considered that the great majority of the men under my command have had very little opportunity for military training, either here or in Canada prior to going out to work with the different forestry companies, their magnificent discipline and behavior is a matter of which all Canadians can be justifiably proud. Many of these men have left families at home, and are looking forward to rejoining them at the end of the war, and it is scandalous that the

minds of these people should be disturbed by the thought that our soldiers are in the midst of dire temptation and are falling victims to it, when, as a matter of fact, the behavior of the men of this corps since its formation has been exceptionally satisfactory, and, it is my opinion, when they return home, they will themselves demonstrate that overseas experience has improved them in every way."

Sir Edward Kemp says he visited the forestry corps at Windsor Forest recently and was very much impressed with the general appearance of the men working there. "They were all clean and smart, and a well-set-up, sturdy lot," he adds. "They are living under excellent conditions, and from what I saw and heard there, I should judge that their behavior is excellent."

Shipbuilding in Australia

Recently the expert engaged in England to supervise the Commonwealth Government shipbuilding scheme arrived in Australia, and is now completing his examination of the various federal, state, and privately-owned plants and yards.

The Commonwealth Government has extensive yards at Sydney; the State Government of New South Wales has a plant at Newcastle, and the State Government of Victoria has extensive yards at Melbourne, all of which (independent of the federal shipbuilding adviser) are managed by competent steel shipbuilders with practical experience in British yards.

It is announced that there will be sufficient steel in Australia to build seven steamers. At the outset some imported materials will be used, but the bulk of the steel will be supplied by the Broken Hill Company's steel works at Newcastle, N.S.W., which, with subsidiary or associated companies, will ultimately be in a position to furnish all the structural steel.

The work will be apportioned to the yards in the several states, and, while no authoritative statement has yet been made as to the size and class of the steamers, it is considered by experts having knowledge of the facilities available that the initial vessels will be about 330 feet long by 48 feet beam, with a carrying capacity of about 3,500 tons.

Review of Current Trade Conditions

Ontario

There has been a rather quiet period for some days in the lumber arena, and whether or not any special activity will develop speedily depends a good deal on the action of the government and the outcome of certain enquiries now being made by United States and British interests. There is little improvement in the building situation, and only houses which are absolutely required are being erected. At least half a dozen towns and cities in Ontario, such as Midland, Brantford, Welland, Windsor, and St. Catharines, require workingmen's homes. In Midland it is stated that, owing to the large shipbuilding plant which is being erected there, 400 dwellings are needed for housing the men. Retail lumber dealers in various parts of the province report but little activity so far, as there is a disposition on the part of contractors, farmers, and probable builders to hold back. It appears in many sections of the country that the fall wheat crop has been killed, and when the average tiller of the soil learns this he is often not in an optimistic frame of mind. The land has to be sowed again with spring wheat, and if he intends building a barn or a new house, or making any additions, alterations, or repairs, he naturally waits until he is assured of a good harvest. This, too, has contributed also to the rather quiet state of the affairs in the province. In regard to transportation, this has improved considerably. The lumbermen up around the Georgian Bay district who were somewhat apprehensive of securing sufficient help to make up crews and run their mills, have found that common labor is more plentiful than was generally supposed, but wages are extremely high. In fact, the exactions in many cases are such as have never faced manufacturers before.

So far as the sale of cuts of 1918 is concerned there is a disposition on both the part of manufacturers and wholesalers to mark time. True, several million feet have been sold, but the great bulk of the lumber has not yet been contracted for. Wholesalers declare that the mills are unreasonable in their quotations and are putting up exalted figures, which the present limited demand does not justify. Manufacturers contend that it is necessary for them to obtain from \$6 to \$12 a thousand more on most lines owing to increased cost of operation, scarcity of help, and augmenting outlay for maintenance. Wholesalers, on the other hand, submit that they have to take all the chances, do the financing in many instances, are being asked more by the mills for certain woods than they (the wholesalers) are getting for their stocks at the present time. They say that they cannot see why they should assume all the responsibility in view of the uncertain state of affairs. In case there should be a drop in prices it will be a heavy one, and then the wholesaler would stand to lose more money than he perhaps has made in many years. Most wholesalers and retailers are not anxious to load up at the present time, owing to the fact that it costs nearly twice as much to carry stocks now by reason of enhanced prices as it did a couple of years ago. It is said that there will be a decreased cut in hardwood this season, but if a few smaller mills are not operating, there is, at least, one large plant in Ontario which will bring on the market about 6,000,000 feet. This is the mill of Manley Chew at Midland, who last fall purchased the Beckwith and Hope Islands, in Georgian Bay, and operated camps there during the past winter, taking out large quantities of maple and beech.

White pine is very scarce, and all stocks of dry lumber are low. One large firm attributes the present quietness to the fact that so many cars have been dumped in yards of late that consignees are using all the men at their disposal to unload the stocks in order not to pay demurrage. The retailer and large consumers are, therefore, not thinking of business very much at the present juncture. He thought that present prices would hold firm, although there had been a slight disposition to come down a little in some quarters. British Columbia products are not moving very freely just now, and representatives of coast firms do not look for any big business for some time, as, previous to the advance, many heavy orders were placed, and retailers are pretty well supplied for the moment. There is not much doing in British Columbia shingles. Lath is moving a little more freely, incidental to spring building operations and repairs.

An embargo was recently placed by the New York Central lines on all shipments east of Syracuse, in order to relieve congestion at the New York terminal of the road, but it is thought this will be removed in a few days.

Word comes from Ottawa that the Dominion Government is seriously considering passing legislation preventing the erection of any new factories or addition to plants other than those engaged directly in the making of munitions or working on government contracts.

Should this eventuate it will be along the lines of similar action taken by the War Industries Board across the border, which has resolved that in the public interest all new undertakings not essential to and not contributing either directly or indirectly toward winning the war which will involve the utilization of labor, material, and capital required in the production, supply, or distribution of direct or indirect war needs, will be discouraged, notwithstanding they may be of local importance and of a character which should, in normal times, meet every requirement; and resolved that, in fairness to those interested, notice is hereby given that the board will withhold from such projects priority assistance without which new construction of the character mentioned will be found impracticable; and that such notice as above shall be given wide publicity, that all parties interested in such undertakings may be fully apprised of the difficulties and delays to which they will be subjected and embarked on the same at their peril.

United States

The third Liberty Loan has closed, the amount being over-subscribed, and in the short, active campaign the lumbermen took a very prominent part. There is a good market for white pine, and supplies are expected in larger number on the arrival of the first water shipments at Buffalo and Tonawanda. In the Georgian Bay district there have been sales of white pine logs at \$45 per thousand, which is a sure sign, according to American advices, that there will be no cheap lumber in that section this year. Prices on hardwoods generally are steady, with an upward tendency for grades and species in most demand. Whether the government will fix the figure for hardwood car materials remains to be seen, but in some quarters such a move is expected. Production is not up to the normal capacity of the mills, and when one condition improves another tightens up. The imposition of embargoes and the growing shortage of labor is also being felt.

In spruce, low grades, suitable for boxing and crating, find a very suitable market, while the requisitions for thick, clear stock are active. There is still some complaints of car shortage. Reports are to the effect that hemlock is in considerable demand, and, on the whole, the market is rather firm. Some Eastern manufacturers are so busy supplying rush government orders that they have little stock to ship to the trade, and the same is true of most districts. The southern pine mills have all the business that they can handle; and, with heavy orders for car material in immediate prospect, there seems abundance of business ahead to keep all plants employed. The two things with which the manufacturers are most interested at the present time are government prices and the labor supply.

There was introduced in the House of Representatives recently a bill to fix an import duty of 50c a thousand on shingles imported, but it is doubtful if the proposition will ever get by. Owing to an improved supply of cars on the Pacific Coast there was a drop in the price of shingles last week. The market expected to recover very shortly. The business in lath is very good, and, were manufacturers in a position to ship to any point desired, conditions would be much brisker, but embargoes intervene.

A matter of concern to manufacturers of Douglas fir is the government price. The Fir Production Board has made more stringent and has enlarged the embargo on foreign cargo shipments of Douglas fir. A careful study reveals, however, that in the long run the mills may be benefited instead of injured by this. Word from Washington reveals that shipment on about 12,000,000 feet of Douglas fir ship timbers for Eastern and Southern yards is to be held up until an inventory of stock can be taken to determine how much more fir is required to finish the 3,500-ton Ferris ships ordered. The order has not been cancelled, although a part of it may be cancelled later. In the modified Daugherty type it seems likely that large Douglas fir timbers will be used to a considerable extent. The car situation has eased up considerably, but there is going to be no dumping of stock on the market.

Great Britain

There has been no material change in the general situation since the last report, and the arrivals of standards and loads of spruce and pine lumber are about the average. No fresh information has come to hand as to the importing probabilities of Canadian goods, and, according to the views of some who are in a position to know, the almost total exclusion of such productions appears likely to remain undisturbed for some time.

The one remaining outlet for the energies of the erstwhile operator in foreign woods is the native timber trade. This business is expanding, if not to a degree commensurate with the efforts of those

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

engaged in it, at least to an extent which is creditable, considering the inevitable disadvantages which has retarded its growth.

As to the difficulties of labor and transport, the present is hardly the time when either can be diminished, and it must be faced that certainly as regards the first no betterment in the immediate future is at all probable. The amended official prices, on the whole, are not exciting dissatisfaction, and, in any case, must be accepted with the best grace possible.

In mahogany and hardwoods nothing has arisen to disturb the hardening trend of values. Prices all round are very firm. Although a fair amount of stock under prevailing importing conditions has arrived during the past few weeks, a set-back in arrivals may occur at any time. This is sufficiently probable to be a source of market strength.

It would seem as if the consumer of hardwoods for work unconnected with the carrying on of the war will be hit by the new demands for men for the forces. This private class of work has been growing less and less important, and now that skilled labor will become exceedingly scarce manufacturers will find a serious difficulty in carrying on business. Of course, the production of articles of luxury will be discontinued, but it is a difficult matter to define whether certain articles are in the nature of luxuries or whether furniture comes in this doubtful class, and whether the making of furniture will be brought to a standstill or not, certainly it will be considerably reduced. Future hardwood dealing, therefore, will, in all probability, be increasingly identified with government requirements, and there is little doubt that the latter will be wide enough to make a heavy demand on all supplies available while the war lasts.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Looks for Fairly Good Season

General conditions in the Ottawa lumber market in the wholesale and retail sphere showed an improvement during the latter part of April and the first few days of May as compared with the previous two weeks and a corresponding period last year. The prospects of a successful season, while not up to the standard at which lumbermen would like to see, are regarded, on the whole, as being satisfactory.

The market increased in strength and the volume of trade was good. Transportation showed further improvement by rail, but water routes were not looked upon as being able to fulfil previous expectations.

Stocks moved more freely than at any period since the year began. Delayed shipments purchased months ago went on their way, and new business in most cases received prompt attention. The foreign and domestic demand increased as compared with the early part of April.

The labor situation in regard to the sawmills showed more promising signs, due largely to some large woodworking plants releasing men they had had to manufacture shell boxes. Most of such labor went to the sawmills and tended to alleviate what had previously promised to bring about an acute shortage of help.

The most disturbing feature of the market came in the low water prevailing in the Ottawa River and its tributaries. If heavy rains do not come quickly or the river raise considerably there is danger that some mills may have to close on account of the shortage of logs.

After running sixteen days to capacity the large sawmill of Shepard & Morse was forced to cease operations temporarily on May 6, on account of no logs being available. Mr. P. C. Walker explained that the situation was due largely to the low water. The Kippewa and Temiskaming reservoir dams, he said, had been left open all winter to furnish power, with the result that there was not in the north country as great a quantity of water to float the logs into the streams as in former years. The spring season had also operated to the disadvantage of the lumbermen whose logs came over the Ottawa River route, inasmuch as the snow had gone away gradually and had not furnished a sudden rush of water to carry logs into the streams. Mr. Jackson Booth said that he understood that the gates of the two reservoir dams had been recently closed for storage purposes. The general opinion in and out of lumbering circles here is that this season's rush of Northern waters, due around May 19 to 26, will not be as great as in former years. In the face of the disturbing prospect of low water, it would not be surprising if some sawmills in the Ottawa district would be forced to close earlier than in former years.

On the water route the situation was none too promising. Navigation, which opened between Ottawa and Montreal on May 1, helped somewhat in facilitating transportation, but not to as great an extent as in other years. Lumbermen and companies depending on the water routes for summer transportation are not optimistic as to the outlook. The chief reason for this depression is that American-owned canal barges may not be available in great numbers. American barges, according to trade reports, would be more extensively used this year on American canals to relieve congestion of railway terminals in the United States and to carry shipments necessary for the prosecution of the war to ocean ports. A per centage of American barges will be available, inasmuch as United States-owned barges will enter Canadian ports with cargoes of coal, sulphur, etc., and, instead of returning empty, will carry back cargoes of lumber.

Only a few of the Ottawa woodworking plants were successful in their tenders for shell boxes; the demand for this stock was not as strong as formerly. From one reliable source the forecast was made that the woodworking plants, in anticipation of receiving large shell

box orders, had laid in their stocks beforehand, but, through the awards of the Imperial Munitions Board, had been left with them on their hands.

A new issue of orders for shell boxes to the total of 224,000 two-round 4.5 inch were let by the Imperial Munitions Board during May. M. C. Neate, Eastview, secured the only local contract, for 28,500 boxes. Plants in Montreal secured contracts for 50,000 boxes, the Digby Lumber Company one for 30,000 boxes, the Canadian Wood Products Company one for 30,000 boxes. Two firms in Burlington, Ont., received a total of 10,000, and plants in Nova Scotia got around 31,000 boxes. A Crysler, Ont., plant secured an order for 35,000. The average price was around 76 cents, and it is understood the lowest tender was about 73 cents. Most of the Ottawa woodworking plants tendered around 82 cents per box.

The Gilmour & Hughson and the W. C. Edwards mills are not likely to be seriously affected by the low water in the Ottawa River, as most of their logs travel via the Gatineau River route.

The demand in the shingle and lath trade and the sash and door trade continued slow. Grades suitable for building purposes did not show much activity.

Montreal Reports Business in Moderate Volume

Business in Montreal is moderate. If lumbermen relied on purely local trade they would be at the starvation point, but fair orders are coming in from the province, and American orders are satisfactory.

The building permits for last month were discouraging. They totalled \$539,890, a decrease of \$83,050; for the year to date the total was \$1,083,325, a decline of \$464,465.

Prices continue to be very high—too high, in the opinion of some lumbermen, who believe that the upward movement, if continued, will tend to restrict consumption and will make for the more general use of substitutes. Wholesalers declare that prices asked by many manufacturers are such that it is imperative to act with the utmost caution, and that to commit themselves to heavy buying of stocks at the prices required is nothing less than a gamble. At present there is every appearance that the market will hold, but there is no telling when a reaction will occur, and to be caught with very large stocks bought at high rates is to invite disaster.

An order for 50,000 4.5 shell boxes has been awarded to Mr. J. Lamarche, Montreal. There has been considerable discussion among box-makers as to the decision of the Imperial Munitions Board not to fix prices, it being claimed by some of the largest firms that the industry cannot be put on a sound basis as long as the board accepts tenders at figures which show little profit or are actually below cost. On the other hand, there are those who assert that there is money in the business even at the low prices. Wholesale lumbermen are now much more cautious in selling box lumber, several firms having lost heavily when certain shell box makers went under. The ordinary commercial box section is very quiet.

Transportation has considerably improved, both to the United States and in Canada. According to a statement issued by the Railway War Board, cars from the United States are continuing to return in sufficient numbers to enable the Canadian shippers of pulpwood, lumber, paper, and other commodities to ship their goods freely, and it is expected that by the time the 1918 crop commences to move practically all of the accumulated traffic of forest products, in Eastern Canada particularly, will have been forwarded.

It is now certain that no space will be available for some time for the export of lumber to the United Kingdom, and it is doubtful

Use Every Bit - No Waste - Always Good

Waste costs money. You can avoid waste in your camp cook-house by using Klim where milk is needed. Klim is the milk solids—casein, albumen, milk sugar, and ash salts of pasteurized separated milk. Nothing is added to increase its bulk or change the natural milk flavor. Nothing is removed from the original separated milk except the water. The resulting KLIM is therefore milk solids.

Klim gives full value. It is all milk food. When dissolved again in water, it has the natural appearance and flavor of fresh liquid milk. It is

packed in 10-pound tins, and remains sweet and fresh in the tin until all used. It will not freeze nor turn sour. Good to the last ounce.

Klim bulks small and saves 70 per cent. in freight charges because it weighs that much less than any other form of milk.

All cooks like Klim. It is easy to use and is convenient in cooking and for making coffee, etc. We will send a sample tin for any lumberman to test because we know it will be convincing proof of our claims.

whether the government will provide accommodation during the entire season except for lumber required for war purposes.

Sulphite pulp is in good request, and prices have had a substantial rise. The mills can dispose of all pulp ready for immediate shipment. Ground wood is steady, with only a moderate demand. A delegation of American newspaper publishers have appealed to the Washington Shipping Board for assistance in sending 60,000 cords of pulpwood from this country to relieve the newsprint situation in the States.

Sales at St. John Rather Backward

While a little change has taken place in the lumber market at St. John, N.B., it is really more the change from winter to spring—the opening of navigation and the starting of the mills to saw the logs coming forward.

Sales at profitable prices are not many, buyers being disposed to treat the high prices with a degree of hesitancy, believing that the manufacturer in many cases is not justified in asking the raise over a year ago. Unless the advance is paid, the sawmill man will not see a very profitable year.

The cut of logs is certainly going to be short of a year ago, and, as explained before, in many cases costing \$10 per M. over last year's prices. Some very limited sales of lumber have taken place at St. John for about \$32.50 for the run of the log. Boards are bringing about the same price, and dry boards are not to be had, the factories using them direct from the saw. Refuse lumber of all kinds is in good demand for boxing purposes for United States points, bringing in the vicinity of \$23 per M., f.o.b. St. John. Laths are going slow, but not to the same degree as a month ago. Shingles have also moved up slightly. In fact, while the market is not overloaded with orders, there is a firmness about it which shows that if there were any heavy demands made upon it prices would still further advance.

Local business at the factories is fair. The St. John factories are very busy. This is not the outcome of any great amount of work, but because of the shortage of help in the plants, caused by men going away practically every day. This is creating serious delays in all work, and no doubt conditions will go on getting worse until the end of the war.

Prices for planed and finished lumber have advanced considerably during the last three months, and bench work will certainly be still higher under present conditions. Only two sawmills are yet in operation at St. John, viz., Stetson, Cutter & Co. and Murray-Gregory, Ltd. Messrs. Randolph & Baker expect to start this week.

All the mills were forced to advance their wages 45c per day per man over last year's prices. This makes a jump of 80c per day per man in two seasons.

The log drives are all coming along well. Reports from the headwaters of the St. John show the drives going well, with good water and some snow and ice still in the woods. No logs should be hung up under the present conditions. The booms at Fredericton are now receiving logs from the Upper St. John, rafting of which will begin about June 1, or as soon as the water recedes so as to permit of it.

Personal Paragraphs of Interest

Edward Clark, of Toronto, and his son Leslie, of Montreal, have been spending a few weeks at Clifton Springs, N.Y.

Ed. Lamieux, a prominent lumber dealer of St. George's, B.W.I., spent some time at Eastern points in Canada recently.

J. B. Reid, of Reid & Co., chairman of the Lumbermen's Section of the Toronto Board of Trade, has returned, after spending the past winter in California.

Robert B. Elgie, of the Elgie & Jarvis Lumber Company, Toronto, arrived home last month, after spending two months in Hot Springs, Ark. He was accompanied by Mrs. Elgie.

H. N. Lee, in charge of the division of timber physics, the Forest Products Laboratories of Canada, Montreal, has joined the signal corps, aeroplane department, of the United States army.

A. J. Morris, of Mobile, Ala., who is a member of the firm of Greig, Morris & Blair, spent a few days in Toronto recently, on business. The company is opening up an office in Mobile in the near future.

W. B. Campbell, of the Forest Products Laboratories of Canada, Montreal, has been on a visit to the Pacific Coast in connection with the work of the laboratories. While in Vancouver he addressed the Forest Club on "Timber Testing."

Captain A. P. (Lally) Maclean, formerly of the 20th Battalion, and later of the Royal Air Force, who was reported missing on March 18, is now officially reported killed in action. Proceeding overseas with the 20th Battalion in May, 1915, he served with this unit as signalling officer in France through the winter of 1915-1916, and then obtained a transfer to the Royal Flying Corps. He was educated at Upper Canada College, and was in the class of 1917 at the School of Practical Science when he enlisted. He was 22 years of age, and the

second son of Mr. W. B. Maclean, of Toronto, president of the Conger Lumber Company. His brother, Captain Gerald A., is also a member of the R.F.C., and is serving with the Air Corps in England.

H. N. Hamilton, of the firm of A. S. Kubbee & Son, lumbermen, Albany, N.Y., died on April 29, in the hospital at Fergus, Ont., where he had undergone an operation for appendicitis. Mr. Hamilton, whose remains were taken to Albany for interment, was well known to the trade in Ontario and Quebec, and his passing will be greatly regretted.

James Playfair, of Playfair & White, lumbermen, of Midland, Ont., has presented the town of Midland with the \$50,000 residence and property recently purchased by him from Mr. Manley Chew, whose family are now residing in Toronto. It is to be used for hospital purposes, and will be known as St. Andrew's Hospital. Some extensions will be added without delay.

Lieut.-Col. Robert H. Webb, officer commanding an infantry unit overseas, has been admitted to the 57th Imperial Casualty Clearing Station, dangerously wounded. According to an official cable received by his wife, who resides at 10 North Place, Toronto, Lieut.-Col. Webb was one of the original members of the Army Service Corps in Canada, having enlisted as a volunteer some fourteen years ago. In August, 1914, Col. Webb went overseas as a lieutenant with No. 12 Divisional Train of the Army Service Corps, and, after being some time in the trenches, was promoted to a captaincy. He was one of the first Canadians to receive the Military Cross in the present war, and has been mentioned three times in despatches, once by Lord French and twice by General Haig. Lieut.-Col. Webb is 33 years of age, and before enlisting was head of the Webb Lumber Company, Toronto.

C. G. R. Boosting Greater Production

With the idea of encouraging the greater production of food, the Canadian Government Railways is urging all employees who are in a position to do so, to apply for tracts of land along the right of way in various sections, and raise crops of garden vegetables, hay, oats, potatoes, buckwheat or grain.

Hitherto in several favorable localities convenient to stations, it has been the practice for the agents and section men to utilize the land to a limited extent for farming purposes. Near many of the country stations will be seen the small vegetable garden, and between stations the strips of land growing potatoes, or longer stretches with quite luxuriant crops of hay. Last year, in response to the call for greater production, there was a very considerable increase in agricultural activity along the right of way, sufficient at any rate to show that there are tremendous possibilities if only more of the land available for cultivation is utilized. It will easily be seen that there are miles upon miles of good land where good crops can be raised. In many sections the land is distinctly favorable.

Last year 182 permits were granted to persons who cultivated sections of land varying from small garden plots to stretches of over two acres. In District No. 2 alone. In No. 1 District one hundred and forty persons took advantage of the opportunity to raise crops. In a comparatively small section of No. 5 District 41 permits were issued and some really good crops were raised. In District No. 3 only 26 permits were issued, and only 18 in District No. 4. Prince Edward Island being such a fine farming district, there was apparently not much desire to utilize any available land along the railway track, for only twenty permits were issued.

This means that during the summer of 1917 some 243 acres were cultivated. According to returns received, the sections under cultivation were as follows:—

District No. 1	100.44 acres
District No. 2	121.74 acres
District No. 3	6.00 acres
District No. 4	9.14 acres
District No. 5	4.35 acres
District No. 6	80 acres

There are no returns showing the extent of the sections cultivated on the right of way on the Prince Edward Island Railway, but the holders of permits there raised good crops of oats and potatoes.

It will easily be seen that in nearly all sections there is plenty of land available for those who are in a position to make use of it to increase production.

The Railway is thoroughly in earnest in its desire to assist in every way possible this greater production movement, and will place all desirable land at the disposal of those who will give a sufficient guarantee of their intention to properly till the soil and raise suitable crops. Permits for sections of land can be obtained from the Superintendents of the various Districts, who will acquaint the applicants with whatever conditions are required. The time for planting and seeding is now drawing near, and all persons desiring tracts of land are urged to make early application. Preference will be given first to employees of the railway, and then to the owners of property adjoining the right of way. All enquiries addressed to the Railway will be promptly answered.

Some Lively Jottings from Ottawa

No decision in the freight rates situation was arrived at by the Board of Railway Commissioners when a body representing the lumbering interests and representatives of the railways met at Ottawa on May 7. The matter of further adjusting of the rates was adjourned until Wednesday, May 15, on which date the situation will be further gone into.

According to a will filed for probate at Ottawa, an amount of \$63,752.97, representing the real and personal estate of the late Charles Magee, president of Dominion Hardwoods, Ltd., Deseronto, is to be disposed of. The personal estate is valued at \$36,052.97, the realty value at \$27,700, and bank and other stocks at \$21,315.

In view of the increased cost of living, the E. B. Eddy Company decided during the first week of May to grant an all-around increase in wages to its employees in the near future. The increase will not only cover paper-makers, but all branches of work in the big mills at the Chaudiere.

The eight-hour tour system in the John R. Booth and E. B. Eddy pulp mills went into effect on Tuesday, May 7. Formerly the men employed in these mills worked on a twelve-hour shift, day and night. By the new arrangement there are three shifts—the first from 8 a.m. to 4 p.m., the second from 4 p.m. to midnight, and the third from midnight to 8 a.m. With the shortened hours the workmen will receive the same scale of wages as they were getting previously. The introduction of the three-tour system at the Eddy mill will necessitate the employment of about fifty extra men.

The John R. Booth sawmill will not operate to capacity this season, nor, it is understood, will it run nights. The mill was not run to capacity night and day during 1916 and 1917. A shortage of logs, no export trade to English markets, and a scarcity of labor are given as the chief three causes for the lessened production.

New Saw Mill is Well Equipped

The new mill of the Prince Rupert Lumber Company, which has been erected at Seal Cove, Prince Rupert, is expected to begin operations this month. The plant is modern and complete in every respect, and the provision for handling logs and lumber is of the most up-to-date character. The Prince Rupert Lumber Company was organized by J. S. Emerson, of Vancouver, who is well known in the lumbering industry on the Pacific Coast. The resident manager is E. F. Doby. The mill will have a capacity of 125,000 feet of lumber a day and 150,000 shingles. This will be on a single-shift basis, which means that the capacity may be brought up to well on to double this on the working of a second shift. The plant is planned to embrace a sawmill, shingle mill, planing mill, dry kiln, and storage sheds. It is understood that a box factory may be added later to take care of the demand for boxes in connection with the fish trade.

How Western Production Has Increased

The total value of production in the forest industries of British Columbia last year was \$48,913,115, compared with \$35,528,000 in 1916, an increase of \$13,385,115, or about 38 per cent.

The most remarkable increase is in the production of pulp, which in 1917 was valued at \$7,447,680, as against \$3,520,000 for the year before.

Seventy-nine thousand, eight hundred and three tons of paper were manufactured, as against 65,229 tons in 1916, an increase of 22½ per cent., and in addition 26,595 tons of pulp were produced, compared with 14,389 tons in 1916 an increase of 85 per cent.

Twenty-three hundred million shingles were manufactured, as against 1,900,000,000 in 1916, an increase of 21 per cent.

Eleven hundred and twenty-nine million feet of lumber was cut, compared with 920,000,000 feet in 1916, an increase of 22½ per cent.

The activity in the lumbering business during the past year is shown by the increase in logs scaled throughout the province, the total having risen from 1,280,000,000 feet in 1916 to 1,647,000,000 feet in 1917, an increase of 28½ per cent.

The forest revenue of the province has reflected this striking improvement by increasing 18 per cent. to a total of \$2,162,170. Included in this is the sum of \$809,000 paid as royalty on cut logs, a figure which breaks all previous records and which exceeds last year's collection by no less than 60 per cent.

Lumber Scaler Launches Charges

In the New Brunswick Legislature recently Hon. J. B. M. Baxter, of the opposition, gave notice of motion involving serious charges against Hon. Wm. Currie, Speaker of the House. He read an affidavit signed by Archibald Murchie, a former government lumber scaler, in which Mr. Murchie declared that he had reduced his report on which stumpage is paid, for the operations of the Continental Lumber Company, of Charlo, Restigouche County, of which Hon. Mr. Currie is

manager, by an amount of more than 2,500,000 feet, at Mr. Currie's request. He said this was in the spring of 1917. Mr. Baxter gave notice of motion for the appointment of a committee of five members of the House to investigate the charges. Premier Foster announced that the members, especially on the government side, would not hesitate to grant such a request with the least possible delay. He read an affidavit from Mr. Currie denying the charge, also an affidavit from Daniel Richards, president of the Continental Lumber Company, Limited, stating that each spring since 1913 hundreds had gone to him to adjust the amount of the scale of the lumber cut by the company, and they had on each occasion agreed on the amount of scale; that, in the spring of 1917, Murchie adjusted the amount of the scale with him as president, and he agreed with Murchie on the amount. Richards says he subsequently informed Mr. Currie, manager of the company, of the amount arrived at, and the company afterwards received from the Crown Land Department a statement of the amount in the same was adjusted entirely by Richards, as president of the company, in accordance with the adjustment. He said that Currie had nothing to do with the settling of the amount of stumpage with Murchie, but pany.

Principles of Bankruptcy Act Endorsed

Endorsation of the principles underlying the drafting of the Bankruptcy Act, which was introduced in the House of Commons at Ottawa by S. W. Jacobs, of Montreal, was made recently at a meeting of the special committee, by a delegation representing the retailers of the Dominion. Members from each of the provincial associations were present, headed by H. Chevrier, president of the Dominion Association, Winnipeg and Henry Watters, chairman of the Eastern Ontario and Ottawa District Retail Merchants' Association.

While the merchants believed that legislation of the character proposed would be beneficial, they were of the opinion that the wholesale merchants would, under the bill as it now stands, receive greater consideration. They urged that retailers were not sufficiently protected, and suggested amendments in this connection.

Claiming that all professional men, and even farmers, should come under the provisions of the act, they declared that "legislation of this nature should not be limited in scope, nor confined to any class, nor recognize any misdemeanor, but it should be wise enough to embrace all classes and conditions of men."

Hon. Hugh Guthrie, chairman of the special committee, replying to the deputation, stated that the amendments proposed would receive serious consideration.

Most Valuable Tree in the World

What is said to be the most valuable tree in the world from a productive standpoint is the Gantor avocado, or alligator pear, near Whittier, Cal. Its average revenue to the owner is \$3,000 a year. At one time it was insured in Lloyds for \$30,000, but the company insisted that a high lattice fence be built about it to avert any damage from wind or carelessness, and it was feared that this might interfere with the health of the valuable producer and two years ago the lattice work was removed, causing a cancellation of the insurance policy. Other alligator pear trees in Southern California produce large returns, but none so far has rivalled the Gantor tree, the fruits from which sell at from 50 cents to \$1 each.

Canada's Forests in British Trade

Canada holds the only large forests in the whole British Empire. Australia, New Zealand, and South Africa have sacrificed most of their original timber to the fire fiend and ruthless exploitation. These facts emphasize Canada's strategic position as containing the only "wood pile" available to the Empire, except those of Russia. Sixty per cent. of England's huge timber demand was, before the war, supplied by the Russian people, for the British Isles then, according to statistics, provided only one log out of eight actually needed for home use.

What part Canada's forests will play in British trade after the war is problematical, but there is no lack of prophets to predict that every square mile of growing timber will double in value under the strain of post-bellum demand from the devastated districts of Europe.

The annual report of the New South Wales Forestry Commission for the last year refers to the satisfactory inauguration of the scheme for replanting trees in the denuded portions of the state's hardwood forests and the proper protection of timber-producing areas. The estimated area of crown and private lands in the state containing timber supplies of commercial value is approximately 15,000,000 acres. The total revenue collected during the year amounted to £67,000, a decrease of £838 on the preceding year. This was anticipated owing to the dislocation of the industry owing to war conditions. Large quantities of heavy hardwoods, specially suitable for shipbuilding purposes, were shipped to the Pacific Coast ports of North America.

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE.—We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

YOUR opportunity in Wood Pulp

Every Canadian Saw Mill or Plant could profitably take advantage of this opportunity. By installing an inexpensive Kraft Soda Mill, all the slabs, tops, bottoms and waste wood may be utilized to produce Wood Pulp. We can place long term contracts for all that Canadian concerns are able to supply. The Swedish supply is practically cut off and Canada has a free field for this business. We will be pleased to send you details of this opportunity.

Navigation Open at North Tonawanda

The steamer "Runnels" arrived on May 2 with a cargo of 600,000 feet of hemlock for Lawrence J. Bates and 200,000 feet of spruce for White Gratwick & Mitchell, this being the first cargo of lumber to be received at North Tonawanda, N.Y., this year. Captain O'Hagan reports having very little ice trouble, especially in Lake Erie, where the ice seems to have broken up and disappeared.

Old residents of the city say this is the first time in their memory that the Niagara River has been clear of ice in the spring, as it usually takes from two to three weeks for it to run out of Lake Erie, flowing over Niagara Falls, breaking up, and disappearing in the rapids.

Newsy Budget of Trade Activities

The sawmills of the Canadian Forestry Corps at Virginia Water, near London, Eng., have been burnt out.

Fraser Mills, the big plant of the Canadian Western Lumber Company, Ltd., manufactured nearly 95,000,000 feet of lumber last year, while shipments aggregated nearly 100,000,000 feet. Of this large quantity less than 3,000,000 went foreign.

The Lakelse Lumber Company, Ltd., has been incorporated, with head office at Prince Rupert, B.C., and capital stock of \$20,000, to carry on business as sawmill owners and operators, lumber and timber merchants, and to manufacture and deal in timber, logs, lumber, and wood of all kinds.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 30th day of May, 1918, for the purchase of License X1306, to cut 1,692,000 feet of spruce and balsam on the S. W. ¼ of L. 2684, Alez Lake, Cariboo District. Two years will be allowed for the removal of the timber.

A building permit for \$75,000 has been issued in connection with work contemplated at the Wallace shipyards, Vancouver. The plans are stated to include two additional berths and the remodelling of the entire shipyards plant in order to start work on the new series of boats with the most up-to-date facilities.

The Deep Cove Logging Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of \$50,000, to carry on a general logging business and the cutting and getting out of logs, bolts, and timber of all kinds; to manufacture and deal in lumber, shingles, sawlogs, sash, doors, etc.

Compagnie des Placagrs Canadiens, Inc., has been incorporated, with head office at Montreal, P.Q., and capital stock of \$150,000, to carry on business as lumbermen, sawmill owners, lumber manufacturers, woodworkers, and to deal in timber, lumber, cordwood, and wood of all kinds. Among those interested are A. P. Beaupre, V. Martineau, and A. Jodoin, all of Montreal.

The building of wooden vessels has been contemplated in Toronto for some time and it is developing rapidly. At the present time there is on the ways of the Toronto Shipbuilding Company one of the largest, if not the larg-

est, ever built by the firm. The new wooden vessel is of 2,500 tonnage capacity. It is 260 feet long, 43½ feet beam, with a depth of 25 feet. This ship is being constructed of British Columbia fir timber.

B. J. Carney & Co., an extra-provincial company, has been registered to do business in the Province of British Columbia. The head office of the company is at 139 North Virginia Street, City of Reno, Nevada, and the provincial office is at Houston Block, Baker Street, Nelson, B.C. James O'Shea, Nelson, B.C., is attorney for the company. The capital of the company is \$30,000, and its objects include the manufacture of timber, lumber, poles, posts, etc., and to operate cedar and lumber camps, yards, sawmills, etc.

That 4,051 men are at present employed in the shipyards of British Columbia controlled by the Imperial Munitions Board was a fact brought out at a recent session of the shipyard wage enquiry. According to a statement filed, the men are distributed as follows: Yard No. 1, Foundation Company, 673; Yard No. 2, Cameron-Genoa Mills Shipbuilders, Ltd., 568; Yard No. 3, New Westminster Construction Company, 558; Yard No. 4, Western Canada Shipyards, 704; Yard No. 5, Coquitlam, 382; Yard No. 6, Lyall Shipyard, 911; assembling plant at Ogden Point, 255.

Two steamers launched in British Columbia shipyards and now being completed will be shortly despatched with cargoes of timber for Great Britain. They will be the first of the Canadian-built Imperial Munitions Board ships of any description to carry timber to Europe since the outbreak of the war, and are the first I. M. B. ships to be chartered for any service. It is probable that they will go via the Panama Canal. Being owned by the British Government, they will be given special authority to navigate the war zone. Privately-owned wooden ships must first secure a special permit for this privilege.

A bill was recently introduced in the British Columbia Legislature by Hon. Mr. Pattullo, Minister of Lands, to fix the price of spruce timber in airplane construction. The price to be paid as compensation to persons from whose land any logs are taken is to be \$6 per thousand feet for No. 1 grade logs and \$2.50 per thousand feet for No. 2 grade logs. In the case of land occupied or used as a right-of-way compensation is to be at the rate of \$2 per thousand feet of all timber cut. The timber in all cases is to be scaled in accordance with the provisions of the Forest Act. In the event of dispute, the decision of the Minister of Lands is to be final.

The benefit of the amendment to the Forest Act, by which discoverers of timber for pulp purposes are to be protected insofar as their costs of location are concerned, has been extended to all discoverers of any timber in British Columbia. Under the old Act, when the locator of timber limits applied to the Minister of Lands for license to cut on the property, the Minister cruised it and advertised for tenders. In many cases the discoverer was outbid and thus lost his time and money spent on locating. An amendment provided that in connection with pulp timber licenses the discoverer would be repaid his expenses out of funds put up by the successful tenderer. A clause has been added by the B. C. Legislature applying this concession to all timber so that the original locator might receive a reasonable sum, within the discretion of the Minister, but not to exceed the cruising cost incurred by the government. The intention of the amendment is to protect the interest of the small locator, who would therefore not lose money in case he was not fortunate enough to obtain the license at the time of auction.

Many Fires in Lumber Mills have been caused by Hot Boxes

This risk can be eliminated by the use of
Chapman Double Ball Bearings

— IN —

Shafting, Hangers, Pillow Blocks
Loose Pulleys, etc.

Chapman Double Ball Bearings

decrease the friction loss 75% and do not generate heat.

No oil is used, a little Tranco Grease once or twice a year is the only lubricant required, consequently dust does not adhere to the outside of the bearing.

There is no spoilage from oil drip, and cleanliness may be easily maintained.

If you realized what these savings mean you will agree that

**You pay for Chapman bearings
whether you buy them or not**

EDGINGS

Ontario

The Dutton-Wall Lumber Company, Limited, has increased its capital stock from \$100,000 to \$500,000.

The Union Lumber Company, Toronto, are now sawing their 1918 stock of white pine, red pine and spruce at their mills at Milnet, Callender and Trout Mills.

Hubbel Bros., of Feraday, have purchased the Pine Lake timber limits in Cardiff Township from the Rathbun Company. The price paid, it is understood, was \$10,000.

The Beaver Board Company, Thorold, Ont., have awarded a contract for an addition to their factory to cost \$50,000. The general contractors are the Piggott Healey Construction Company, 36 James Street S., Hamilton, Ont.

Representing millions of dollars of invested capital in Toronto, an important organization has been formed which is known as the Building Owners' and Managers' Association of Toronto, and which has for its objects the furthering of the interests of the owners of large buildings in the city and vicinity. The association was formed recently, and the following officers for the first year have been elected: Chas. P. Muckle, president; G. A. Hodgson, first vice-president; F. A. Kent, second vice-president; W. C. Dawson, secretary-treasurer.

The Department of Lands, Forests and Mines for Ontario has let contracts for taking out 25,000 cords of hardwood in the Algonquin Park. This wood will be used next winter for heating public institutions. The government is showing the way to municipalities in taking time by the forelock and providing ample fuel for the coming winter in view of the threatened shortage of coal. By furnishing the scores of publicly owned buildings with hardwood, the Ontario Government will save thousands of tons of coal which can be used for other purposes. Hamilton and Guelph are also availing themselves of the government offer to enter Algonquin Park Reserve, and they have men already at work cutting down the timber. The latest city to make an application for wood is Belleville. Permission is sought to take out 2,000 cords, which will be granted. Other places are following suit.

Eastern Canada

C. H. Russell, wholesale lumber, has removed to 803 McGill Building, Montreal.

The Richard Manufacturing Company, Kedgwick, N.B., recently lost their lumber mill by fire, which is partly covered by insurance.

Lafontaine & Freres, sash and door factory, St. Stanislas, P.Q., have been registered. Among those interested are J. A. and L. Lafontaine.

Jones Bros. cut of two million feet of logs at Carsonville, N.B., recently arrived at Apokaqui, where the timber will be sawed during the coming season.

The plant of the Howland Pulp and Paper Company, Howland, Maine, has been purchased by the Brompton Pulp and Paper Company, of East Angus, Que. The output of the plant is fifty tons of sulphite pulp, fifty tons of sulphate pulp, and twenty-five tons of sulphite bag paper a day.

Walter Jackson, manager of the St. John River Log Driving Company, stated recently that the jam of logs held at the Coffee Mill at Grand Falls for the past two years by the lowness of the water was brought out lately by the rapid rise in the water due to the heavy rains of the past few days.

Holmes, Hogue, Limited, has been incorporated, with head office at Montreal, P.Q., and a capital stock of \$99,000, to carry on the business now conducted on Chatham Street, Montreal, by Holmes S. Hogue & Company. The new company will carry on a general lumbering business. H. Hogue and S. Holmes, of Montreal, are interested in the new concern.

The town of Laval de Montreal has passed by-laws guaranteeing loans to be made by the Fabrique de Bois, Limited, and La Compagnie de Fabrication de Bois & Metaux, who proposed to establish industries in the town. The Department of Municipal Affairs of the Province of Quebec, however, has quashed these by-laws, apparently on the ground that by-laws are not in the public interest.

Compagnie des Placages Canadiens, Inc., has been incorporated, with head office at Montreal, P.Q., and a capital stock of \$150,000, to carry on business as lumbermen, sawmill and planing mill owners, lumber manufacturers, and to sell and hold timber limits, timber lands, and standing timber. Among those interested are A. P. Beaupre, V. Bartineau, A. Jodoin, of Montreal, and J. A. Vincent, A. Phaneuf of St. Hyacinthe.

An organization which promises to be of great value to New Brunswick is the New Brunswick Forest Club, Limited, of which Mr. W. B. Snowball, of Chatham, is the president. The club is composed of lumbermen and persons engaged in the forest service of the province, or employed as foresters by private companies. At a recent meeting in Fredericton, papers were read on the administration of forest lands, the utilization of by-products from sawmills and the elimination of waste in logging operations. Hon. E. A. Smith, Minister of Lands and Mines, was made a life member of the club.

The Legislature of the Province of New Brunswick has passed a law prohibiting the export of pulpwood from the Crown lands of the province. The holders of wood lands in New Brunswick have had the right up to the passage of the law to interchange the wood cut from fee and Crown lands. The holders of woodlands were allowed to cut and ship wood from Crown lands if they replaced the wood so cut by wood from fee lands. This right no longer exists. At present the Province of Ontario has granted the holder of woodlands the temporary right to interchange wood cut on Crown lands with fee land wood.

Western Canada

The War Cayuse, a 2,500-ton wooden ship, was launched successfully at North Vancouver recently, the third of its kind to take the water from the Lyall Shipyards.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 8th day of July, 1918, for the purchase of License X1147, to

cut 7,387,500 feet of yellow pine and Douglas fir on an area situated four miles south of Princeton, B.C. Five years will be allowed for the removal of the timber.

Timber berth 571, near Hope, was sold at auction at the Crown timber agent's office in New Westminster recently, for \$4,560, to Langs and Roddis, of Rosedale, who will build a sawmill and shingle mill in the vicinity and log the timber immediately.

The Bridge River Timber Company, Limited, have been registered. They will build and operate sawmills, planing mills, cut logs, build flumes, logging railways, etc., in British Columbia.

The Deep Cove Logging Company has been incorporated with head office at Vancouver, B.C., and a capital stock of \$50,000, to carry on business as lumbermen, lumber merchants, mill owners, lumber and shingle manufacturers and to operate and lease sawmill, shingle mills, etc.

The O'Connor Logging Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of \$10,000, to purchase and otherwise acquire timber licenses, timber leases and timber lands; to carry on business as timber merchants, sawmill and shingle mill operators, etc.

The Beaver Cove Lumber and Pulp Company, Limited, has been incorporated, with head office at Vancouver, B.C., and capital stock of \$1,000,000, to carry on business as timber merchants, sawmill owners, loggers, lumber merchants and to manufacture and deal in lumber and wood of all kinds.

Sponsored by Mrs. W. E. Collings, of Seattle, the ship War Haida was launched by the Cameron-Genoa shipbuilding plant, Vancouver, recently. The War Haida is the second to be launched of the four wooden steamers the Cameron-Genoa Mills Shipbuilders, Limited, contracted to build for the British Government.

The Tack Logging Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of \$30,000, to carry on business as timber merchants, sawmill, shingle mill, pulp mill and paper mill owners, loggers, and to manufacture and deal in sawlogs, timber, piles, lumber and wood of all kinds.

The Southgate Logging Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of \$200,000, to carry on business as lumber and timber manufacturers, and to manufacture and deal in saw logs, timber, shingles, laths, sash and doors, and all articles and materials in the manufacture whereof timber and lumber, or wood is used.

Sir Douglas Cameron returned recently to Winnipeg after spending four months in British Columbia, where he has for many years had large interests. In an interview he stated that the timber output last year was the largest, according to the official returns, in the history of the province. There is considerable activity in shipbuilding, a large force of men being employed, and this will continue indefinitely owing to the world demand for shipping.

B. J. Carney & Company, an Extra-Provincial Company, has been registered under the Companies Act and is authorized to carry on business in the Province of British Columbia. The head office of the company is at 139 North Virginia Street, City of Reno, Nevada, and the provincial office is a Houston Block, Baker Street, Nelson, B.C. The capital stock of the company is \$30,000, and they will manufacture, buy, sell and deal in cedar poles, posts, timber and lumber of all kinds.

A gang of men lately commenced laying track on a spur to the site of the Timberland Lumber Company's new sawmill on the south side of the river, just across from New Westminster, B.C. All preliminaries having been completed, it is the intention to build, the first step being to lay a spur from the B. C. E. R. tracks, on which the necessary materials will be transported and which will later serve the mill for shipping its product. It is hoped to have the mill in operation by the beginning of November.

According to word received by W. A. Blair, secretary of the Vancouver Board of Trade from F. C. T. O'Hara, Deputy Minister of Trade and Commerce at Ottawa, the three wooden vessels, War Yukon, War Songhee and War Puget, all British Columbia-built vessels, will carry full cargoes from the coast when they leave on their initial trips. The Board of Trade recently took up with the Ottawa authorities the question of providing cargoes for boats leaving Vancouver, pointing out that through lack of tonnage on the coast a congestion existed in the export trade.

The Lumber Products Limited, which has for some time past been operating on property leased from the Brunette Sawmills in Sapperton, B.C., the site formerly used by the Iowa Lumber Company, has now completed a deal for a permanent home, having purchased five acres on the North Arm, at Queensborough, including the site and building of the defunct nail factory. The property purchased is five acres in extent, and has about six hundred feet of water frontage. The present wharf on the property will be extended, in order to give depth for the vessels which will load the output of the plant. It is anticipated that construction will begin shortly, and it is hoped to have the sawmill operating by the fall. Its capacity will be 60,000 to 70,000 feet a day.

Of vital interest to lumbermen and the business interests of British Columbia is the news that efforts which have quietly been exerted for several months past looking to the establishment in Vancouver of a branch of the Forest Products Laboratories of Canada are now certain of success. The new laboratory will be equipped at the outset with all necessary machinery and appliances for the carrying out of wood-testing experiments on the lines pursued at the parent laboratory maintained by the Dominion Forestry Branch at McGill University, Montreal, where invaluable work has been carried on despite the gradual reduction of the staff from 45 experts to about 30 at the present time, this being due to the war. Scientific demonstrations in tree chemistry were initiated in 1913, the wood-testing department being added in 1914.

The Compensation Act adopted by the Alberta Legislature at the recent session applies to employees of lumber yard concerns. A delegation of lumber dealers, headed by the Hon. W. H. Cushing, of Calgary, called upon Premier Stewart while the bill was in committee and pointed out the hardships that would be endured at this stage if the provisions of the measure were applied to lumber yard employees. It is with the utmost difficulty that the yards of the prairies are manned to-day, and the new charges that will be imposed under this Act will cause infinite trouble and expense. The subject has been referred to Secretary N. G. Neill, of the Western Retail Lumbermen's Association, to see what can be done to have the provisions of the Act suspended during the war. The Manitoba Government, in considering a similar measure a year ago, took into consideration the claims of the lumber yard men, and it was not applied to them.

—the unproductive scrap heap

Is your mill up-to-date or are you still content to allow that pile of sawdust, shavings, ends, slabs, etc., to prove a burden instead of big source of income. With the big prices which prevail for wood pulp and those chemicals distilled from waste wood it will pay you to consider installing the necessary plant to make the scrap heap productive—and then write us! We have specialized in chemical-producing plant for over 75 years and have installations in all parts of the world.

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention !

We have the ONLY device that removes ALL danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, breakdowns or dislocation of parts—IT WORKS ALWAYS. Though still new, it is thoroughly tried and tested, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you TEN times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you CAN use them with this equipment; you need it on your cars right now, and you will WANT it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

You Can Insure Your Investment in Standing Timber

In timberland transactions a mistake is worse than a fire. In what other field than lumbering will you find men investing a half-million or a million dollars in raw material on a MERE GUESS as to what they are getting for the money? Yet how many lumbermen do you hear lament that a tract doesn't cut over two-thirds of what the "cruise" indicated?

A LACEY REPORT will INSURE you against that sort of thing. It is much more than a "cruise"—is, in fact, the nearest possible approach to modern scientific accuracy of actual knowledge—made under a system of notes, measurements, original volume tables and cross-checks which it has taken the LARGEST TIMBER FACTORS IN THE WORLD, James D. Lacey & Company, 38 years to perfect.

The cost of the insurance afforded by a LACEY REPORT is scarcely a fair insurance premium on the values protected.

Send for booklet, "Pointers."

Steam Power Skidding and Loading Machinery

will not only take the place of men to a large extent, which is an exceedingly important point in these days of man shortage and high costs of labor, but

Will Move Your Logs at Greater Speed, and at a Lower Cost

than could possibly be accomplished by man and horse-power alone, and do it the year round. Let us demonstrate this to you.

We make steam power Skidding and Loading Machinery in a large range of sizes, suitable for small, medium, or large camps, and for large or small timber.

The small operator or the large one can save money, increase output, and reduce costs by the use of this machinery.

Marsh Engineering Works, Limited

Established 1846

Belleville, Ontario

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

Dividends from Air

AN EFFICIENT OUTLAY

1. A Canadian Ingersoll-Rand compressor giving maximum air output per H.P. input, built for long and steady service.
2. "Little David" air tools; the wood-borer, simple, light, easy to handle, few parts and all interchangeable.
3. The "CC-25" Drift-bolt driver, powerful and speedy.

With such an outfit you are sure of results,
convenience, speed and reliability

Dunlop "Gibraltar RedSpecial" Belting

Abnormal Friction Pull vs. Elasticity of Friction

BETWEEN every ply of specially-selected, heavy Cotton Duck in Dunlop "Gibraltar RedSpecial" Belting is a layer of pure Rubber which, through a Dunlop calendering process, so permeates the fabric that it binds the several plies into one integral piece.

Some belt manufacturers offer to sell their product on the basis of "Heavy-Poundage in a Friction-Pull" Test. To obtain the latter result it is not necessary to secure such an expensive Rubber Friction as is used in "Gibraltar RedSpecial." This fact alone ought to be a pretty good gauge of the value of the "friction-pull" test.

In buying "Gibraltar RedSpecial" you get the advantage of years of careful laboratory work on our part with this result: The friction is of that "just-right" elastic quality which allows for the give and take necessary in rounding the pulleys; hence the reason "Gibraltar RedSpecial" is known for maximum Power, Speed and Service.

Note the Short Grain Rubber Friction

This Belt Section illustrates a Heavy "Poundage-Pull" Friction. To secure this result the Friction Grain is short and stiff. Elasticity and Flexibility have been sacrificed to secure such a result.

Note the Long Grain Rubber Friction

Dunlop "GIBRALTAR REDSPECIAL" has a Friction of Special Dunlop Rubber that retains its life indefinitely "Note the long grain Rubber Friction," as illustrated. Elasticity has not been sacrificed for Abnormal Friction Pull.

UNLIMITED capacity for service is an intrinsic quality with Dunlop "Gibraltar RedSpecial" Belting. The success of nearly a quarter of a century in the manufacture of Rubber Products is built into Gibraltar. The original Made-in-Canada Red Rubber, Frictioned Surface Belting, "Gibraltar RedSpecial" has stood the infallible test of time in turning the wheels of industry in a multitude of Canadian plants from the Atlantic to the Pacific.

The Dunlop Unreserved Guarantee

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where the "Gibraltar" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

GRATON & KNIGHT

Standardized Series LEATHER BELTING

Tanned by us for belting use

47 Years of Service

20-inch and 26-inch Graton & Knight double belts in plant of A. G. Dewey Company, Quebec, Vt., the oldest satinnet mill in the United States, and the largest in the world.

One of these belts was installed in 1870 and the other in 1880. Both are still running, after an average of 42 years of service. Both give evidence of many future years of efficient work.

One of them has travelled ten hours a day continuously, a total of 3,250,000 miles, and has never needed repair.

Fifty years ago, Graton & Knight Leather Belts were made to the highest standards then attainable. Today their quality is actually better.

*The Babbitt Metal that's at the Front in Efficiency
and Economy*

HARRIS HEAVY PRESSURE

THE ARISTOCRAT OF BABBITT METALS**SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well. So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours
JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS****THE CANADA METAL COMPANY, Limited****Head Office and Factory TORONTO Fraser Avenue****Branch Factories—****HAMILTON****MONTREAL****WINNIPEG****VANCOUVER**

This is a snap shot of the Adams Pointer

“Game for Anything”

Adams Pointers

Adams Pointers will tackle the heaviest work and surprise you with their powers.

These sturdy little crafts with their well built easy running engines are in use all over the Dominion.

Our catalogue and blue prints will explain the various advantages which Adams Pointers have over alligators and tugs. Lumbermen are quick to see that it is cheaper to work with an Adams Pointer.

- (1) They will dog with perfect ease and safety in any class of timber.
- (2) Will dog just as easily, frozen maple or hardwoods of any description
- (3) Will dog the last board, just as easily as they dogged the first one.
- (4) They do not tear the board or stock.
- (5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer. P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different classes and styles of Edgers, for either light or heavy duty.. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canter, Steam Lifters, and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

CLIPPER SHINGLE MACHINE

Our regular model Clipper Shingle Machine has the staunch good working qualities of all Long Mill Machinery. It is the best of its kind and cannot be equalled for Shingles or Heading.

We have the following on hand ready for shipment

One Clipper Shingle Machine, slightly second hand

One Clipper Saw Jointer, slightly second hand

One portable Saw Mill outfit with Right hand Saw Frame and Carriage—
set of track timbers, also the following items:

No. 1 Log Jack with foot wheel and idlers.

No. 7 Log Jack with foot wheel and idlers.

10 inch by 36 ft. Steam Feed.

10 inch by 42 ft. Steam Feed—Either feed can be furnished with vertical
or horizontal valves.

Double acting set works in No. 1, 2 and 3 sizes.

We have one second hand plain slide valve engine, right hand, side crank,
9 x 13, suitable for a small saw mill plant.

Write at once for information regarding the above or any other machinery you may need

BRANTFORD, ONTARIO, CANADA

"FROST KING" METAL

Our thirty-five years' experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal, made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 35c per lb., Fort William and East; West of Fort William, 40c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 90c per lb.; West of Fort William, \$1.00, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

\$5,000,000.00

worth of mixed metal
sold annually.

Kendall Gang Circular

The Machine that will convert your small logs into more and better lumber, quicker than ever before.

The illustration shows one of the latest designs of gang circular patented by Mr. I. N. Kendall, the well-known millwright, of Ottawa. This machine takes 16-26 in. diam., 10 gauge saws—will cut cants up to 8 inches in thickness, and we furnish with it necessary saw collars for any thickness of lumber desired. It has a hollow mandrel, water cooled saws; each saw has a separate guide; easily accessible and readily adjustable, and the bridge tree is so designed that it can be removed, the saws taken off and a new set put on in 7 to 10 minutes. Safety fingers hung just inside the front press roll prevent a cant flying back off the saws. Lumber cut on these machines is guaranteed to come out absolutely true to size from end to end, and so smooth that 1/16 in. over size is all the allowance necessary for finish.

Read what one user says about it:—

"The machine has given every satisfaction and in many cases far exceeded my idea of sawing lumber; the proof of this being that our customers are paying me \$1.00 to \$1.50 per thousand more for certain classes of lumber than they can purchase same quality elsewhere—this advantage being purely on account of the uniform and smooth sawing this saw is capable of doing."

We are the original manufacturers of these machines

We have been manufacturing them for the past thirteen years, and the experience gained in all those years is at your disposal. We make these machines in three sizes, as follows, using

- 26-in. saws for 8-in. cants, as illustrated.
- 32-in. saws for 10-in. cants.
- 36-in. saws for 12-in. cants.

Each size is of the very latest design and up-to-date in every improvement.

May we send you a list of satisfied users

We also make a complete line of twin circulars with chain or steam feed for slabbing logs for these machines.

D.K. McLAREN'S

Genuine British-Oak Tanned
LEATHER
BELTING

**"The Willing Horse
 Gets the Hardest Work To Do"**

So McLaren's is always put on the difficult runs

There are many reasons why you should use McLaren Belting on your machinery, but take only the question of wearing quality and you will find this genuine oak tanned belting outwear any you have yet used. This remarkable feature has brought the product into prominent use. McLaren's is invariably picked out for the hardest work and difficult runs. Engineers and machinists are unstinted in their praise of McLaren's Belting. "It works better," they say. Test it on your machines; be sure every roll you buy bears the all-important brand of the Oak Leaf. None genuine without it.

We welcome your investigation. Write Head Office and Factory.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

No. 11

Adoption of the Trade Acceptance Method and Why

Greater facility of effecting settlements between buyer and seller, more elasticity with regard to available funds and the abolition of the open account system, which has tied up in the past many millions of dollars in both Canada and the United States, have caused the trade acceptance method to be welcomed by the lumber and many other business interests.

To the uninitiated, the first question asked naturally is, what is a trade acceptance? The answer is that it is a negotiable security arising out of a current transaction in merchandise. It is somewhat different from a draft or a promissory note; in this respect, that a trade acceptance is confined to credit obligations arising from the sale of goods, and must have a definite maturity, while drafts may cover various kinds of transactions and be payable on demand, at sight or at the end of a stated period. The trade acceptance is different from the ordinary promissory note as its use is limited exclusively to the obligations arising from the sale of goods, while a note may represent practically any form of obligation.

The advantages of the adoption of the trade acceptance method are fully set forth in a special article covering the matter which appears in the news columns of the "Canada Lumberman," and these points need not be reiterated. A trade acceptance is sent out at the time of the invoice is despatched, and across the face of the acceptance are blank lines for filling in the date, the place at which the payment is to be made, the location of the bank and the signature of the acceptor. There is sometimes printed the words "That the obligation of the acceptor hereof arises out of the purchase of goods from the drawer. The drawee may accept this bill payable at any bank, banker or trust company which he may designate."

When the trade acceptance is signed it is returned to the drawer after which he may deposit it in the bank as collateral or discount it. It converts an open account into negotiable security. It is said that

in the United States some four hundred millions of dollars, which have been tied up by the open account system have been released into active operation or credit. Many firms who are already making use of the new plan emphasize that no just claim is prejudiced by the giving of a trade acceptance. Unlike a note or draft, a trade acceptance cannot be renewed, in whole or in part, at the time of maturity, and has to represent an actual transaction between buyer and seller in the matter of merchandise. The seller either holds a trade acceptance until maturity or arranges to have it negotiated while the acceptor either pays it on the date due or secures an extension of time, which may be done by treating it as a past due obligation, or covering it by a promissory note. A trade acceptance is not given for borrowed money or past due obligations, as in the case of a promissory note, etc.

Someone may inquire why the trade acceptance is particularly important just now. Because the need of utilizing commercial credit to the fullest extent is emphasized by the war's demands. The retail lumberman, wholesaler or manufacturer may easily introduce the trade acceptance method, which has been endorsed by the Canadian Lumbermen's Association and the Wholesale Lumber Dealers' Association, by making it a condition of sale, or by sending out a communication, following it up with a trade acceptance. It is particularly important that firms which take acceptances should also give them, as the fact that a concern gives trade acceptances serves as a timely and substantial argument to lead customers to adopt the same method of settlement.

The Place of the Wholesaler in Lumber Distribution

In connection with the problem of rising costs, now and then some economic advocate looms up who declares that the way to reduce expenditure and keep the price of things down to a minimum is to abolish the wholesaler, the jobber, the middleman, the distributor, the go-between, etc.—for he is known in various lines by a variety of titles. By one fell swoop, these ardent supporters of radical reforms would annul such a system of marketing and thus affect a substantial saving! They would eliminate one profit, at least, and afford ready means of acquiring commodities at a figure as near as possible to the actual cost of production. Such vain theorists might go a step farther, wipe out the retailer and have all manufacturing enterprises conduct their business direct, take all travellers off the road and have every person requiring anything send straight to the plant, and thus get it by mail or rail.

It has been generally found, when certain concerns in certain lines shout loud and long about there "being no middleman's profit," that they manufacture goods themselves, and thus "save the people money," there is not a great deal in their pretentious claims. These firms are generally manufacturing themselves and not only secure the margin which production demands, but add on a just proportion for what the wholesaler would get—if they bought through him. Such doctrines may look well in print or as speculative propositions, but they seldom work out satisfactorily or equitably in practice.

There will always be the wholesale distributor as long as supply and demand have to be met and the different wants of individuals and communities catered to. In all merchandising methods, the wholesaler has and holds a proper and justifiable place. He is not a fifth wheel to the coach, an embargo on costs, a traditional, arbitrary nuisance, or economic evil, as some would lead the consumer to suppose.

In the lumbering industry, as in others, if it were not for the wholesaler, who is a "guide, philosopher and friend" to the retailer, in not a few instances, many small mills would not be in operation today. The business would gradually drift and develop into the hands of larger and influential concerns. Monopolies and mergers would, in all likelihood, be the outcome, and the little fellow would go to the wall, for he would not be able to withstand the strong competition.

The wholesaler encourages, supports and finances propositions, takes innumerable risks and undertakes obligations which have to

be shouldered by some one. He is a barometer of trade conditions, a direct and ready selling medium, a supply man, the builder up of connections between manufacturer and retailer, the pioneer of new avenues of trade and of wider distribution. He assumes responsibilities and carries many along in business who, but for his assistance and co-operation, would not be able to pull through the trying conditions of the present period. The wholesaler naturally has to depend upon the retailer for his business. Their interests are in many respects mutual, and interdependent. Not every organization can maintain a large and efficient staff of sales representatives to go direct to the trade. The wholesaler acts not only as the outlet of one mill, but several. Anyone who carefully analyzes the lumber situation in its processes of manufacture, sale, distribution, and consumption appreciates the fact that the wholesaler is essential to the welfare and upbuild of its varied activities, and is not an artificial interference with supply and demand. On the contrary, in the magnitude and expansion of the business, with its numerous ramifications, he is serving in a logical and legitimate sphere and is a strong link in the chain of industrial and mercantile life.

Selling Lumber on the Basis of So Much Per Piece

Since the lumber industry had its inception it has been the practice to sell the product on the 1,000 feet, b.m., basis. This unit has been established so firmly that, like old traditions, it is hard to break away from its association. In the retail arena today, when extensive building operations are restricted by reason of the war and the high cost of materials and labor, the average yard man finds that a great deal of his business consists of small jobs or lots for repair work, alterations and renovations. The old Scotch saying, that "many mickles make a muckle," is as true at this moment. Small orders help move the stock and, in the aggregate, are not to be despised.

Many a large mercantile organization has been reared upon the nimble five and ten cent piece. These miniature coins formed the nucleus of the fortune which erected the Woolworth skyscraper in New York, the tallest structure in the world, fifty-seven storeys in altitude. So in lumber distribution, it is the odds and ends which mount up rapidly. Not many customers require a thousand feet or more; perhaps only a few boards to lay a new veranda floor, build a back stairs, do some panelling or erect a dog house. To them that order is just as important and interesting as is a large quantity to the contractor or constant consumer of lumber. When the buyer of a few boards goes to a yard and is told that such material is so much per thousand, he is not vitally concerned. The information is too vague. What he desires to know is what half a dozen or a dozen pieces will cost, and many a yard man is not in a position to give a prompt reply. He either guesses and says "about so and so," or figures too high or too low. It takes time, patience and some ability to furnish a per piece quotation.

In all banking institutions there are authentic books which tell what the interest is for so many days or months on any specified sum. These tables are accurate and ready and save an endless lot of figuring and delay. In a similar sense, and with the idea of providing the average yard man with a compendium that will inform him exactly what so many boards, etc., of such thickness, width and length will cost per piece, the National Lumber Manufacturers' Association, of Chicago, has come to the rescue. Whether lumber sells at twenty, thirty, seventy or a hundred dollars per 1,000 board feet, this booklet, recently issued, gives the data instantly. The tables are admirably arranged and, by means of them, the yard man can learn immediately what any size piece of any grade will cost the customer. For instance, should the buyer require a board, 1 x 4, 10 feet long, of a grade selling at \$40 per 1,000 feet, the book shows that the cost will be 13 cents, or should he want a piece 2 x 4, 16 feet long, of a grade worth \$65 per 1,000 feet, it will be 69 cents. Thus retailing conditions in the lumber arena are making progress and, with this ready reference, nothing need be left to doubt or guess work, for the tables are all complete and comprehensive.

Putting Stop to the Practice of Issuing "Bad Checks"

It does not matter whether the word is spelled "check" or "cheque," in a communication reading, "Enclosed please find check covering the amount due you," the recipient, in the lumber industry, as well as all other lines of business, finds that in not a few instances the small piece of paper which was intended to serve as a settlement in full or part of an account, is not honored by the bank on deposit, and is returned to the depositor marked "N.S.F."

It has been said that the sweetest words in the English language are "home" and "mother." This has been humourously parodied in the effect that the most attractive terms in the line of spoken thought are "Please find check enclosed." It is difficult to convict anyone of a criminal offence who writes a check knowing that, at the time of its issuance, there was not money enough to his credit to protect the paper, if the drawer has an account with the institution on which the document has been made out. The person issuing the check, even if it is post-dated, may put forth a reasonable defence or plausible plea to the effect that he was under the impression that there were funds on the right side of the ledger to meet it, or that he fully expected to deposit enough in the interval before the presentation of the slip to satisfy the claim. Of course, a drawer could not go on indefinitely resorting to such subterfuge, as he would in all likelihood be convicted of intent to wilfully defraud or to get money under false pretences. The fact that he has an account at the bank on which the "scrap of paper" is filled in, is taken as prima-facie evidence, except under extraordinary circumstances, that the individual or firm in question acted in good faith. When a check goes to protest, the drawer, if at all anxious to safeguard his financial reputation, usually endeavors to meet the paper to preserve a semblance of accredited business status.

Primarily, if a person draws a check on a bank where he has no account, then he can be convicted of fraud, but there are very few parties, outside those openly flagrant of the law, who revert to such a deceptive move. On the other hand, there are business firms, and even individuals, who will issue checks knowing at the time that they have not the funds to protect the paper, or hoping, by some fortuitous circumstance, their ship may arrive in the meantime. Thus they may follow successfully this species of kite-flying. Frequently, in the case of customers of limited credit, checks will be handed to persons having business relations with them and these documents may be presented at the bank half a dozen times or more before they are honored. This causes the holder and the bank itself a lot of worry and extra labor. The question arises, is it not time that a law was enacted in Canada to put a stop to the practice of drawing "bad checks." The system in this country has been rather loose.

New York State has taken a progressive step in this direction which is of much interest to credit men and the business community in general. The penal code of the state has been amended by what might be termed the "bad check" law, and the new measure goes into effect on September 1st next. Briefly, the amendment provides that a person who, with intent to defraud, draws a check on a bank knowing that he has not sufficient funds in, or credit with such bank to meet the check, shall be guilty of attempted larceny. If money or property is obtained from another through the device of issuing such a check, then the drawer is guilty of larceny. The fact that payment is refused by the drawee depository because of lack of funds or credit shall be prima facie evidence of intent to defraud and of knowledge of insufficient funds in or credit with such bank, unless the maker shall have paid the drawee the amount due thereon, together with interest and protest fees, within ten days after receiving notice that the instrument has not been paid by the drawee. The word credit as used in the amendment means an arrangement or understanding with the bank for the payment of the check, draft or order.

Lumber Products, Limited, Brunette Street, New Westminster, B.C., have plans in progress for the erection of a sawmill on the north Arm of Fraser River, Lulu Island. The mill will have a capacity of between 60,000 and 70,000 feet per day. The present wharf on the property is to be extended.

Use of Trade Acceptance Grows Steadily

The Plan Heartily Endorsed—Difference Between the New Method and Ordinary Draft—How Buyer and Seller Benefit by Abolishing Open Accounts

At the April meeting of the Wholesale Lumber Dealers' Association, Inc., the Chairman, Mr. A. E. Clark, in the course of an address upon the work done at the annual meeting of the National Wholesale Lumber Dealers' Association of the United States, inserted a few remarks about trade acceptances and suggested that the committee on terms of sale should think about the matter and present a report upon it at an early date. Although the committee was unable to report at the May meeting of the Association the subject was taken up by the members present and discussed pretty thoroughly. The upshot of this is that, at no distant date, it is probable that trade acceptances will be heard of far more frequently among lumbermen in Canada than they have been in the past.

Effective Acknowledgement of Account Due

The trade acceptance is first cousin to the draft, which is well known in Canada already, and to this extent we have had the advantage of this form of settling an account for a long time past. But the trade acceptance, as it has been adopted in the United States since the creation of the Federal Reserve Bank, and which it is proposed to adopt more generally in Canada is a much more effective form of acknowledgement of an account due, than is the draft.

The most important difference between the draft and the trade acceptance is the fact that the latter is not renewable. If the acceptor of a trade acceptance desires an extension of time the only way in which he can obtain it is by covering it with a promissory note. Under such conditions the man who accepts a trade acceptance will consider far more seriously the duty of making payment on the due date than he would in the case of a draft which he knows can be renewed in part or in full.

The ordinary distinction between a trade acceptance and a draft is that the acceptance is confined to credit obligations arising from the sale of goods, and must have a definite maturity. The draft may cover various kinds of transactions and may be payable on demand, at sight, or at the end of a stated time. The trade acceptance is limited to obligations arising out of the sale of goods while a promissory note may cover practically any kind of obligation.

There are many benefits arising out of the use of trade acceptances, both to the buyer and the seller.

Benefits to the Buyer

For the buyer the benefits are briefly as follows:—

It develops careful buying.

It enables him to keep better track of his outstanding obligations, thereby avoiding the evils of over-extension.

It strengthens his credit and puts him in the position of a preferred buyer.

It develops in him the habit of prompt payment and furnishes him with an excellent excuse for requiring prompt payment from his customers.

It enables him to realize that credit is as tangible as cash and should be guarded and used accordingly.

It eliminates wastage and lost motion attending the open book account method.

It releases business capital for new transactions.

It improves the chances of the buyer of small means to operate in successful competition with the large buyer.

It helps the buyer by making him deal always in current transactions rather than in long drawn out book accounts.

As the buyer often becomes a seller, the same advantages that apply to the seller apply to him.

It serves as a tonic to the business organizations concerned.

It prevents the accumulation of overdue accounts.

It develops a sounder and more serious attitude towards the buyer's own obligations.

Benefits to the Seller

The advantages which the seller derives from the trade acceptance method are equally important.

It relieves him from the burden of financing his customers and the consequent burdening of his own capital.

It enables him to conduct business on a more systematic basis, with a more regular income schedule.

It puts the burden of proving correctness of the details of the merchandise transaction where it belongs—upon the buyer.

It reduces the expense of collections and simplifies the process by making it a detail in banking machinery.

It promotes the economical treatment of merchandise and enables the seller to do business at a smaller operating cost.

It relieves him from the necessity of selling his accounts at the high rate of interest usually exacted.

It enables him to offer the bank additional security.

It strengthens the seller's financial statement.

The seller inoffensively assists the buyer to complete his contract in the way in which he originally intended to complete it.

It enables the seller to facilitate his customer's business by the extension of credit and by deliveries in a way not always possible under the open account system.

TRADE ACCEPTANCE		No.
TORONTO, CANADA	19	
ON		PAY TO THE ORDER OF
UNION LUMBER COMPANY, Limited		
DOLLARS, \$		
THE OBLIGATION OF THE ACCEPTOR HEREOF ARISES OUT OF THE PURCHASE OF GOODS FROM THE DRAWER		
To	UNION LUMBER COMPANY LIMITED	
DATE	PAYABLE AT	BY PER
LOCATION OF BANK	SIGNATURE OF ACCEPTOR	

The form of trade acceptance used by the Union Lumber Co. of Toronto, for some time past.

It gives the seller two-named paper to present to his bank for discount.

It enables the seller to dispose effectively of the possible necessity for subsequent proof of the legal status of the transaction and to exhibit for inspection the highest possible class of book accounts.

In the face of all these advantages it is difficult to see how objection to such a beneficial system can be raised, yet it is certain that the process of bringing about the general use of the trade acceptance will be slow and difficult. Probably the wholesaler will be fairly quick to adopt it, but the retailer will think about the farmers, contractors and others who are chronic slow pay as they depend to so great an extent upon the receipt of their own money at long intervals, and require goods in the meanwhile. There is everything in favor of the retailer adopting this method, however, both in his buying and selling. Those customers of his who stand out against the system can be dealt with all the more effectively when the trade acceptance system is in use, as it will be a simpler matter to insist either upon settlement by trade acceptance or the payment of interest upon an open book account.

To introduce the system is a simple matter for any dealer who

wishes to do so. It amounts merely to a matter of making the trade acceptance a condition of the sale, or of writing an explanatory letter and following it up by a trade acceptance.

From the lumber dealer's point of view there is another advantage in the trade acceptance which should be remembered. The fact that the transaction has been made the subject of a trade acceptance must automatically render the transaction far more binding than it is under the ordinary open book account method. There will be far less cancelling of orders under the trade acceptance than there has been formerly.

In Canada, where we have been educated to the use of the draft far more than in the United States, the important features of the new system are the definite date of the trade acceptance; the fact that it is not renewable, and the fact that across the face of the acceptance there is printed a statement that the obligation of the acceptor arises out of the purchase of goods from the drawer. It is possible also to provide space on the face of the acceptance for entering particulars of the goods purchased, and this is a frequent practice.

The interest which is being taken in the trade acceptance by the Wholesale Lumber Dealers' Association, will in all probability lead to the general introduction of this system in eastern Canada.

Will Insist on Getting Copies of All Tariffs *The Lumbermen Want to Know Character of Any Changes in Time to Make* *Formal Objection if Necessary—The Railway Board Appealed to*

The monthly meeting of the Wholesale Lumber Dealers' Association, Inc., was held on May 17th at the Queen's Hotel, Toronto. Mr. W. C. Laidlaw presided, and there was a good attendance. A number of matters of importance were discussed, chief among them being the situation in connection with the extension of the fifteen per cent. freight rate increase by the railway companies, to cover, not only domestic rates, but the portion of the rate on a through haul which covers the United States end of the haul. The transportation committee reported that two conferences had been held between representatives of the railway companies and representatives of the Wholesale Lumber Dealers' Association and the Canadian Lumbermen's Association, to discuss this matter, the meetings taking place at Ottawa. Up to date there had been no definite results from these meetings, but the representatives of the lumbermen had presented a strong case and it was now up to the railway companies to declare whether they intended to take any steps towards meeting the wishes of the lumbermen in the matter.

The Freight Rate Difficulty

There was a long discussion on this matter and it was apparent that the members of the Association were determined that their interests in the question should be vigorously pushed, even to the extent of applying to the Board of Railway Commissioners for Canada for a suspension of the tariff now in effect which permits the railways to collect this charge. Just what steps will be taken depends upon the attitude of the railways. There is no doubt, however, that the lumbermen will not permit the matter to drop without pursuing it to the end.

In connection with the same matter the Association also took a determined stand regarding the filing of tariffs with the Board of Railway Commissioners. In this particular case information that the tariff would come into effect on April 20th only reached the lumbermen in a very round-about manner on the afternoon of April 19th, when it was too late, as it turned out to prevent the tariff from going into effect. The Association wrote to the Board of Railway Commissioners asking to receive copies of all tariffs affecting lumber in future, as soon as they are filed with the Board. The reply to this request was a reference to the Canadian Freight Association, and a statement that the Board did not issue the tariffs and so could not furnish copies. Application to the Canadian Freight Association brought a reply that copies of all tariffs affecting lumber could not be furnished and that application would have to be made for each particular tariff desired. This leaves the lumbermen in the dark, as they cannot guess when important tariffs are about to be filed, and the same unsatisfactory situation is likely to develop any day as that which occurred in connection with the fifteen per cent. case. What the lumbermen want, and what they intend to obtain if there is any possible way of obtaining it, is to be furnished invariably with copies of all such tariffs, in plenty of time to make formal objection to them before they go into effect.

In order to bring about this result the secretary was instructed

to write to the Railway Board again, sending them a copy of the letter from the Canadian Freight Association and asking the Board to issue instructions for copies of all tariffs affecting lumber to be furnished to the Secretary of the Canadian Lumbermen's Association at Ottawa.

Trade Acceptance Meeting with Favor

Another important matter discussed was the proposal to make use of the trade acceptance in Canada. This matter came up at the meeting in April, when the Chairman, Mr. A. E. Clark, told of the discussion of the subject at the annual meeting of the National Wholesalers' Association at New York. It is now in the hands of the committee on terms of sale of the Wholesale Lumber Dealers' Association, Inc., and, from the tone of the discussion at the meeting it is evident that the members of the Association are strongly in favor of the general use of the trade acceptance. Not only do they wish to see it used by the wholesalers, but by the retailers, as a means of reducing the large amount of money lying idle in open book accounts. The wholesalers all expressed the conviction that the retailers could make use of trade acceptances even for their small accounts, by insisting upon its use or upon the payment of interest upon any open book accounts. It is certain that, as a result of the wholesalers taking up this matter, the use of the trade acceptance will become fairly general in the lumber trade in future. The committee on terms of sale will report upon the matter at the next meeting of the Association.

Increased Membership Negotiations

In connection with the proposal to extend the membership of the Association so as to take in wholesalers in Montreal, Ottawa and other eastern centres, it was decided to place in the hands of the executive and the Chairman the duty of appointing a committee to represent the Association at a conference with a committee of the Canadian Lumbermen's Association which has already been appointed for this purpose.

The embargo upon shipments of shingles to Cartier, Ont., for furtherance was discussed, and it was decided to write to the C. P. R. regarding the matter, asking that the embargo be removed.

Mr. McDermid, of the Union Lumber Company, Toronto, referred to the advisability of using, in connection with accepted orders, a clause to the effect that the price at which the order is accepted is based upon existing freight rates and that any additional rates or any extra charges or taxation imposed by the government must be assumed by the buyer. The Union Lumber Company is making use of a clause of this kind and Mr. McDermid offered to furnish a copy of it to any other wholesalers who wished to use it.

Several other matters of lesser importance were discussed and the meeting then adjourned.

The first wooden vessel built in nearly half a century in Quebec City, was launched recently in the St. Charles River at the ship yards of Quinlan and Robertson Company in Limoilou Ward. The ship is one of six which are under construction in Quebec city for the Imperial Board, and indications are that more wooden vessels will shortly be built.

Why Lumbermen Want Changes in W.C.A.

Also Desire an Alteration in Some of the Regulations of its Managers — Big Firms Pay in More than Aggregate Awards to Injured Employees

By H. I. Thomas, Ottawa, President Lumbermen's Safety Association

With considerable interest I have read the remarks of the chairman of the Workmen's Compensation Board of Ontario, in a recent issue of your periodical. I think that Mr. Price will agree with me that the paper on "Workmen's Compensation," which I had the honor to read at the annual meeting of the Canadian Lumbermen's Association, and to which he refers at some length, has served a useful purpose, if only in creating discussion and arousing the interest of employers in an important subject, to which, hitherto, their attitude has been somewhat apathetic.

I deprecate as much as does Mr. Price any entrance into controversy, and it is in no factious spirit that I venture to send you a few words in reply to the statement given out by the board and published in your paper.

The comparison of the prevailing rates in certain states of the American Union and those in force in Ontario is misleading, as employers in those states have the option of insuring themselves, or, on giving proof of their financial stability, can arrange to pay individually to their injured workmen the actual awards of the board. If the larger lumber operators of Ontario had been given the options enjoyed by the lumbermen of New York State, the cost to them of workmen's compensation in the last three years would, I think, have been less than it has been.

Always Favored Current Cost Plan

The chairman of the Ontario Board is in error in stating that I have changed my views on the current cost plan. I have always advocated it, both before and after the passage of the Ontario act. In 1916 I told the Hon. Mr. Lucas and Mr. Price that I had become more or less

Mr. H. I. Thomas, Ottawa, Ont.

reconciled to the capitalized system, as I saw at that time very little prospect of bringing about the change I desired to see. However, any alteration of the opinion of individuals on this matter is, of course, merely of academic interest.

With regard to the provision of medical aid, it is true that the board cannot change the law, but the recommendations of the Canadian Lumbermen's Association were addressed to the Attorney-General of the province. Personally, I am convinced that if the suggestions of the Canadian Manufacturers' Association, made when the amendments governing medical aid were being considered, had been adopted by the Ontario Cabinet, there would have been more satisfaction amongst both the doctors and workmen, as well as the employers.

As far as the safety associations are concerned, the chairman of the board seems to have entirely mistaken the object of the suggested change in the scope and purpose of these associations of employers. If it is not taxing your space too greatly, the matter can best be explained by printing in full the letter of the writer to Mr. Price in this connection, more especially as the extracts therefrom which the chairman of

the board quotes have little meaning when removed from their context. The communication in question reads as follows:

"Mr. Hawkins has consulted me with regard to some correspondence he has had with you relative to an address which I recently made at the annual convention of the Canadian Lumbermen's Association in Montreal.

"I understand you take exception to the statement that 'the safety associations have fallen under the control of the board.'

"If you will read the context you will see that I did not imply, and I am satisfied that my hearers did not understand, that the board interferes with the details of management of these associations; far less did I complain of any measure of control that is exercised.

"On the other hand, I cannot believe that you would wish to deny the control by the board of the finances and general policy of the safety associations. As far as the Lumbermen's Safety Association is concerned, I have always, directly or through Mr. Hawkins, obtained your consent to any action of importance—such as the appointment of inspectors and the secretary, and the salaries to be paid these officers. Indeed, Mr. Hawkins' visit to you the other day was to obtain your consent to a change in the work of our inspector. Furthermore, you have always exercised a wise supervision over the expenditure of our funds, and I have always understood that you could, at any time, withhold the money grants, without which our association could not operate. If this is not 'control' I do not know the meaning of the word.

"Now, as long as the safety associations are confined to the prevention of accidents, the control by your board is quite desirable, and I am free to say that, as far as my observation goes, it has been most wisely exercised, and has made for economy and efficiency in the operation of these associations.

"You have apparently missed the point of the fifth recommendation in my paper, which, I am glad, and somewhat flattered to know, has aroused your interest. I am desirous of greatly extending the scope of the safety associations, so that the prevention of accidents would be only a part of their activities. I was suggesting that they not only have power to make representations to the board in any matters affecting their group, but that they should carry appeals from the decisions of the board to the appellate tribunal, which I suggested should be established. For example, in the case of this firm, your board recently ruled that clerical employees should be included in our returns—if I had my way, our association would appeal that decision.

"It is manifest that, if the powers of the safety associations were thus enlarged, the associations would have to be relieved of all control by the board, which would merely act as a collecting agency for the funds required, as otherwise an altogether anomalous situation would be created.

"As long as the safety associations retain their present status, I should be sorry to see the present degree of control by the board abolished."

I do not believe that the lumbermen are dissatisfied with the administration of the Act by the present board, but they want certain changes in the measure itself, coupled with an alteration in some of the regulations of its managers. The lumbermen who operate on a large scale have, at the root of any dissatisfaction which they may feel, the knowledge that the aggregate of the awards to their injured employees is vastly less than the amount of the assessments they have paid.

The Canoe River Lumber Company, Limited, have been incorporated, with head office at Kamloops, B.C., and capital stock of \$10,000, to carry on business as timber merchants, sawmill proprietors and lumber growers; to manufacture and deal in articles of all kinds in the manufacture of which timber or wood is used and to purchase and deal in timber limits or concessions.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 22, 1918, for the purchase of License X1293, to cut 24,394,000 feet of spruce and balsam on an area adjoining S.T.L. 3327P, Dome Creek, South Fork Fraser River, Cariboo District. Five years will be allowed for the removal of the timber.

Should the Yard Man Prepare Plans?

Giving Estimates and Taking Contracts is Favored by Some and Strongly Opposed by Others

Should the retail lumberman prepare plans, furnish estimates and carry out contracts is a question which has been seriously considered by practically every yard man.

The problem is more personal and pertinent today than ever, owing to the general slackness in building operations. Any system that will bring more grist to the mill, create new business, stimulate fresh interest, extend structural undertakings or the sale of lumber is worth while reviewing from all sides even if no unanimous conclusion is reached. After conversing with representative dealers in many parts of the Dominion, the "Canada Lumberman" believes that each retailer should be governed by local conditions, weighing all the pros and cons carefully and studying his trade at close range. What are his facilities, manufacturing or otherwise, and what are his relations with contractors; who are his principal customers; do they reside in the town or country, and would this "service department," as some call it, interfere with architects, carpenters, woodworkers and other legitimate trade? How far should the yard man break away from the beaten path; what do his competitors undertake, and has the yard man himself any practical building experience or skill as a draughtsman? Do too ambitious and too numerous enterprises really yield any one lasting advantage? Does it not pay handsomer returns in the long run to concentrate and specialize and observe the principle of "every man to his own trade?" There is a wide diversity of opinion as shown in the following interviews which the "Canada Lumberman" has secured with lumber merchants in different provinces.

"We have found from experience and the habits of this section of country, that the best way for mill men is to keep as close to their mills and yards as possible. We estimate on all kinds of buildings, supply the contractors with materials and leave all planning to the architects. By so doing, we are all on friendly terms and can assist one another. We live and let live and consider that our business is the better off by handling it this way," says a Western Ontario firm.

Another concern doing business in southwestern Ontario declares that they do not prepare plans or take contracts for houses, but leave this work entirely to contractors who are their principal customers.

Depends Much on the Contractors

"Does it pay for a retail lumber yard to give estimates, plans, and specifications and do contracting work or not. That, I think, would depend entirely on the size of the town, the ability and standing of the contractor," says a leading member of the Ontario Retail Lumber Dealers' Association, who continues:

"I find for myself, living in a small town, that it pays me to give estimates, also rough sketches, as well as do contracting.

"All building material has advanced in price and I find that few contractors, if any, like to take the contract for a building out and out, also, if they do take a contract the material being high, as I said before, I do not care to run any risk with them, as the contractors I find, as a rule, are not worth very much financially.

"I find also that the contractors and carpenters frequently ship in a lot of their material required for the contract, thinking they are buying it for less than they could get it for from me, and thus saving money. I have known this to be done without even asking me for a price.

"On the other hand, in the cities or larger places, where they have more than one good contractor, I believe it would not pay a retail lumber yard to do contracting, as they would lose the trade of not only the large contractors, but all the carpenters, as the contractors and carpenters would be able to buy all their material from other lumber yards in the same place, while in a small town there is not more than two yards and in some only one. I consider that it pays me to contract in order to secure the supplying of the material."

"Yes, I do contracting and take the entire work for any kind of building. I prepare plans and sketches and give estimates. I think that this service is necessary if a man wants to develop his business to the fullest possibilities," says a retail lumber dealer in Quebec, who also operates a planing mill.

Is the Expense Too Heavy for Returns

Another eastern member of the trade says: "We cannot speak with much certainty regarding the advisability of the yard man drawing plans, but if it should develop that it is necessary to do so, why we would undertake the work. We are willing to undertake anything practicable to secure more business, but, if such a course would entail much cost without a corresponding remuneration, it would, in our opinion, not pay."

"No, I do not believe in a yard man accepting contracts. That work should be left to the contractor. While in some cases we give estimates on quantities required for certain work we do not prepare

any plans or sketches. My business is to sell lumber and all supplies in that line, and by specializing and keeping a complete stock, I think my trade has reached larger proportions than if I had done contracting or gone into some side issues." This is the view of a dealer who does business in a New Brunswick town.

A veteran lumber firm in Nova Scotia state that it is frequently necessary for them to accept the entire contract in order to secure the supplying of the material. Another retailer in Northwestern Ontario declares that for a few years he prepared plans, but that these were peddled around, and, in a few instances, handed over to a competitor, so he cut it out.

Money-Making Suggestions for Lumbermen

Marsh Engineering Works, Ltd., Belleville, Ont., have recently issued a neatly printed and very attractive booklet, entitled "Suggestions for the Lumberman." The work is produced on fine-coated stock and liberally illustrated. The object of the publication is to furnish timely and practical suggestions for members of the industry on using machinery in the place of men for loading and skidding in the woods. Never was the labor problem as perplexing as at present, and, by reason of decreased help, many operators have not been able to get out nearly the amount of timber they have contracted for. It has been found that with the aid of machinery the work of men can, to a large extent, be replaced, and accomplished in less time and at a lower outlay.

All the methods shown in "Suggestions for the Lumberman" have been worked out successfully, and nothing is left to conjecture or theory. Through numerous years of trials in various camps the equipment supplied by the Marsh Engineering Works have been found economical, efficient, and satisfactory. The methods suitable for the smaller lumber camps requiring only a limited expenditure for machinery, to the plans adopted for larger camps and more extensive operations, are fully set forth and described. From the hand-power winch, which may be used with either a guy derrick or a stiff-leg derrick, and will handle any load the wagon or sleighs may bring in for shipment on the cars to the mills, to the steam power loading, with single drum hoisting engine for speedier loading than can be done by hand-power, many valuable suggestions are presented. The booklet contains full details of loading by hand and by steam power, with one and two-line derricks, with derrick cars and with a tree in place of a derrick.

Other features ably covered are skidding on the ground for short distances or longer distances using steel cones, cableway skidding; loading and skidding combined, car-pulling engines, car outfits for loading and also for loading and skidding, etc. There are also important suggestions for the millman in the line of apparatus for manipulating heavy timbers, small cars for handling lumber and power apparatus. The Marsh Engineering Works announce that they will be pleased to send copies of this convenient and instructive booklet to foremen or heads of departments, and the publication is one worth while.

Operating Expenses Greatly Reduced

The North American Pulp and Paper Company, which has extensive timber, pulp, and paper interests in Quebec, including the Chicoutimi Pulp and Paper Company and the St. Lawrence Pulp and Lumber Company, has issued its report for the year ended December 31, 1917. The accounts show a surplus of \$105,165, as compared with a deficit of \$309,360 in the previous year. The gross earnings were \$3,528,451, a falling off of \$434,659, but against this the operating expenses, of \$2,839,097, were \$524,000 lower, while an increase of \$421,137 in "other income" helped to swell the total receipts. Minority stockholders' proportion of profits in controlled companies was \$59,563, reducing the final balance for 1917 to \$45,602. In accordance with an agreement made in October, 1916, President J. E. A. Dubuc has turned over to the company 59,302 shares of his personal holdings, which he undertook to do if the net earnings in 1917 were less than \$1,500,000. A similar guaranty for 1918 is held by the trustees of the company from Mr. Dubuc.

Sees Big Future for British Columbia

George M. Seaman, of the Seaman Paper Company, New York and Chicago, who is a director of the Whalen Pulp and Paper Mills, Vancouver, recently paid a visit to the Pacific province. He predicted that within the next few years the income from the production of pulp and paper, so rapid has been the development, will be between forty and fifty million dollars. Mr. Seaman thinks that when British Columbia is able to get coastwise rates through the Panama Canal to the Eastern coast for its products it will open for the province the wonderful Eastern market, and that British Columbia pulp and other forest productions will be carried to the Eastern seaboard at as favorable rates as European products.

Canadians Against the New Inspection Rules

Proposals Offered by Hardwood Lumber Association and American Hardwood Manufacturers Would do Away with Certificate at Point of Shipment

"One Set of Hardwood Inspection Rules" is the announcement which comes as the outcome of a meeting of lumbermen held in Chicago some time ago. There has been sent out by T. M. Brown, of Louisville, Ky., chairman of the gathering, a circular letter to the members of the National Hardwood Lumber Association and the American Hardwood Manufacturers' Association. In Canada, there are some thirty members of the former body, firms which do an export business to the United States.

The official notice says in part:—

Fully realizing the imperative necessity of mobilization and absolute harmony in the ranks of all industries to the end that our government may have the united support of all business interests; therefore, be it resolved:

Whereas, there exist to-day two sets of inspection rules governing inspection and measurement of hardwood lumber; and

Whereas, confusion has resulted therefrom, which in some measure has hampered our government in its war program; be it

Resolved, that the undersigned members of the organizations named do hereby respectively petition as follows:

That the Hardwood Manufacturers' Association of the United States agree to the adoption of the inspection rules and measurement of the National Hardwood Lumber Association, conditioned upon the adoption of the following changes in the existing regulations:

First—That the official inspection and measurement of hardwood lumber at the point of origin and the issuance of certificates therefor be discontinued, except on lumber purchased by the United States Government or our Allies.

Second—That in the event of disagreement regarding inspection or measurement between the buyer and seller the official inspection of the National Hardwood Lumber Association be available only with the consent of the seller.

Third—That the official interpretation and application of the National Hardwood Lumber Association rules of inspection, the absolute management of the inspection department, which shall include the hiring and discharging of inspectors, shall be vested in a committee of five (5), to be selected as follows:

One from the National Hardwood Lumber Association.

One from the Hardwood Manufacturers' Association of the United States.

One from the American Hardwood Manufacturers' Association.

One from the Michigan Hardwood Manufacturers' Association and the Northern Hemlock & Hardwood Manufacturers' Association jointly. The fifth to be selected by these four, which committee shall elect its own chairman.

Whereas, we feel that the differences between the two sets of existing inspection rules and measurement are of no real import; and

Whereas, the mutual interests of the United States Government and the hardwood manufacturers demand a single standard for the inspection and measurement of hardwood lumber; be it

Resolved, that we, the undersigned hardwood lumber manufacturers, respectfully petition the adoption of these recommendations by the National Hardwood Lumber Association and the Hardwood Manufacturers' Association of the United States.

The net result of the foregoing recommendations, if they are adopted at the convention of the National Hardwood Lumber Association, which meets in Chicago on June 20 and 21, would seem to be that while there may be grading rules there will virtually be no inspection. The proposals are so untimely and ill considered that, at a meeting, held in Toronto this week, of local members of the National Hardwood Lumber Association, it was unanimously decided to enter a strong protest against their acceptance.

An Advantage to Canadian Shippers

For some years there has been maintained in Toronto an inspector of the National Hardwood Lumber Association—Mr. John J. Miller—

and Canadian firms, who have developed business across the border, could make shipments to their customers direct from the mills. On the inspection and certificate of the national inspector, consignments would go right through. This eliminated all possibility of dispute. The new plan, if it carries, will wipe away all this service and remove inspection entirely, as well as the original certificate. In the event of a disagreement between the parties of a transaction, an official inspection, even when the shipment has gone forward and been delivered, will be available only with the consent of the seller. Is the present method, which has worked so amicably and equitably, to be cast in the scrap heap? Inspection and measurement at the point of origin and the certificate have proved a desirable protection and created a bond of confidence between buyer and seller.

The proposed arrangement is so one-sided and short-sighted that, to Canadian members of the National Hardwood Lumber Association, it looks very much like an instance of "the tail wagging the dog." By the system which has been in vogue the principle has been recognized that, in all matters of possible contention an ounce of prevention is worth a pound of cure. There will, by the suggested regulations, be opened up a fruitful field for dispute, which inspection and certification at the shipping point obviated. By the proffered juggled arrangement, the interest and welfare of the buyer are prejudicially affected and placed completely at the mercy or whim of the seller, who holds the whip end. The recommendation eliminates the principle of fair play and mutual confidence, on which all reputable and solid business relations are established and which are fundamental to the prosperity and stability of the N. H. L. A. If the proposal is favored, it places the whole situation so that the only man who can get a fair deal is the seller, which is neither right nor just. Little or no consideration is extended to the buyer.

Individual Rights Given No Consideration

In regard to the proposal that, in the official interpretation and application of the N. H. L. A. rules, etc., these shall be left in the hands of a committee of five, who will have carte blanche with regard to inspectors, their engagement and release; is this not delegating very arbitrary and far-reaching powers to a select few? The rank and file membership is left without any voice or judgment in the matter. Originally, the inspection rules of the N. H. L. A. have always been prepared by a representative committee of the whole body. Everything has been gone into thoroughly and the views of the manufacturers secured. The rules were then printed and presented to the entire association. After a decision was reached they became official. The Association acceded to this method which operated satisfactorily to all concerned.

Now, it is the purpose to vest all this in a committee of five, taking the proposition entirely out of the hands of the individual members of the N. H. L. A. The committee to be appointed will be constituted of one from the N. H. L. A., one from the Hardwood Manufacturers' Association of the United States, which has always been opposed to the National Hardwood Lumber Association, one from the American Hardwood Manufacturers' Association, a new organization made up from the members of the N. H. L. A. and the H. M. A. of U. S., and one from the Michigan Hardwood Manufacturers' Association and the Northern Hemlock and Hardwood Manufacturers' Association jointly, the fifth member to be selected by the foregoing four. The Michigan Association and the Northern Manufacturers' Association are really local bodies of the National Hardwood Manufacturers' Association, and the rights of all other branches or territorial associations, which are vitally interested, have been eliminated and ignored.

Why Change the Present System?

The principle of uniform inspection is a splendid and far-seeing one, which has always been sought after, and the present arrangement regarding measurement and certificate at the point of shipment has worked out smoothly and satisfactorily to all concerned. If the contemplated regulations are carried out, Canadian members of the National Hardwood Lumber Association feel that they will have no rights and any benefits, which they have derived from past identification with this body, will be nullified by the so-called "reforms" which are so inimical in character to the buyer and so unrepresentative in spirit and application to individual interests and co-operation.

Lumbermen May Do the Patrol Work

Likely to Organize New Protective Association and Guard Limits in Same Way as in Quebec

A new forest protective body or incorporated company or association may be formed by leading lumbermen in Ontario during the fall or early in 1919. The purpose of the new body, if it comes into being, will be the patrolling and looking after of extensive limits covering scores of square miles in Eastern Ontario.

The needs and usefulness of such a body operated by lumbermen has been more or less evident for the last two years.

No definite action has yet been taken. There is no cut and dried policy to be pursued. The problem of patrolling and looking after the large tract which it is proposed should be taken over is strictly up to the lumbering interests.

The Minister will be judge of rules and conditions or perhaps in a sense a sort of referee to see that the forest protective game is properly and efficiently played by the lumbermen.

Briefly, the proposal is that the lumbermen carrying limits in the area in question get together and devise a schedule or system of operation permitting them to take over the patrolling of the area from the Ontario Government. Some lumbermen feel that the cost of patrolling as compared with the charges of the Ontario Government, one cent per acre or \$6.40 per square mile, can be reduced and at the same time an efficient patrol maintained.

The lumbermen have got to put forth a concrete proposition coupled with an amount of efficiency, at least, equal to that exercised by the patrols of the government, before the government will transfer the patrol work to the lumbermen.

The area to be embraced by the new undertaking includes all the watershed of the Ottawa River and its tributaries in Ontario, owned by many different limit holders.

The cost of operation and patrol work as conducted in the province of Quebec over an area of something like thirty-two thousand miles by the Lower Ottawa Forest Protective Association amounts to something very closely to half what is being charged for patrol work in Ontario under the government's system. As an instance, wages paid for outside help in fighting fires in this large area in Quebec last year amounted to something less than fifty dollars for the entire season.

There is no chance of the present protective association taking over the work in Ontario, and consequently a new body will have to be formed or incorporated if the lumbermen do their own work in Ontario.

While in quite a few sections it was reported the lumbermen concerned felt reasonably sure they could conduct the patrol work just as efficiently at a lower cost to themselves, there are certain dangerous spots in the territory embraced by the project. The Cochrane district is generally known as a "bad one," and consequently a very close patrol would have to be kept in this sector. If the lumbermen took over the patrol it would mean a bigger expense per square mile than other parts of their territory. On the other hand, it is a debatable question whether it would not be better for the lumbermen to let the government patrol continue in the Cochrane district and pay the one cent per acre charge on limits. Now arises the nice question, will the government patrol the dangerous sector at the same general rate of one cent per acre as it has been charging for the combined less dangerous limits averaging on a general risk? The carrying charges will be distributed pro rata on acreage, in the event of the new protective body being formed.

Lumber Merchant Fails in Damage Suit

Mr. Justice Weir rendered judgment in the Superior Court, Montreal, recently, dismissing the action of Fred T. Smith, lumber merchant, Montreal, who sought to recover from H. R. Goodday and Company, lumber dealers, of Quebec city, a promissory note for \$3,900, together with \$3,250 loss and damages plaintiff alleged he had suffered through defendants non-fulfilment of a contract for the supply of a certain quantity of lumber.

The lumber, it was said, was to have been shipped to plaintiff in April, 1917, but although the latter forwarded his note in payment for the same, he complained that no shipment had been made as ordered. The lumber sent was, he said, of an inferior quality to the kind ordered. It was through failure to send the right kind that plaintiff claimed damages.

Defendants pleaded the lumber sent was of the quality ordered and submitted, and plaintiff could not sue for the return of his note unless he returned the lumber shipped to him or paid for the same. Thereupon plaintiff acknowledged receipt of certain lumber, for which

he agreed to pay \$2,391, and was willing to have that amount credited to defendants on account of the damages he alleged.

Justice Weir said the evidence established that the lumber shipped to plaintiff by defendants was in fulfilment of the contract between the parties, the terms of which were altered by consent from \$15 to \$10 per 1,000 feet. Such alteration did not constitute a distinct and separate sale between the parties. Plaintiff, under the circumstances, had not proved any loss or damage suffered by him, and was not entitled to any such claim. Seeing Article 2268, of the Civil Code, and considering plaintiff had not paid defendants for the lumber shipped to him, the Court said he was indebted to the value thereof, namely, \$2,391.02, which he had not paid or offered to pay to defendants, and he was not entitled to claim back from defendants his promissory note for \$3,900 until he had paid the said sum of \$2,391.02. Defendants were entitled to keep possession of the promissory note as security for their claim until it was paid. Plaintiff's action was, accordingly, dismissed with costs, but the Court reserved to him his right to recover the note in question as soon as he had satisfied defendants' claim against him for the sum of \$2,391.02.

Should Organize Private Properties

Frank Pauze, of Montreal, writes the Canada Lumberman as follows: "In a recent edition of your paper I noticed an article headed 'New Lumber Association Suggested.' I do not think this represents what I said at the meeting in the Chambre de Commerce of the mining and lumbering committee of which I am chairman.

The committee, in making a study of fair prices of fuel wood compared to current prices of sawn lumber, came to the following conclusions:

Fuel wood is only an adjunct to the coal business instead of being its competitor.

The legal cord of 128 cubic feet is not made use of in that trade.

The prevailing price of cordwood being relatively higher than serviceable lumber tends to disorganize the production of both.

The present scarcity of coal offers a good occasion to find a means of stabilizing the price of fuel wood and methodically developing our forest products.

The forestry products come from two main sources: A, from licensed lots; B, from private properties. The operations carried on in class A are well organized. The products in class B are in no way coordinated, although they form an amount of business larger than in class A, it has no head or tail, it is reserved to speculation and hazard.

The report says that a mechanism ought to be provided to give a direction to the production classed as B. It suggests a name to that mechanism, names a few of the attributes it should have, and also states that private initiative should take the matter up rather than request a government organization.

In presenting the report I added that the Quebec year book showed annual forestry products amounted to \$30,000,000 in round figures, and that more than half this amount belonged to class B.

My object in giving you these details is to show that the idea was not exactly the formation of a new lumber association."

New Brunswick New Forestry System

Through the recent enactment of the new Forest and Forest Fires Acts, the province of New Brunswick has aligned itself with the most progressive governmental agencies on the continent in forest conservation, says "Conservation." The administration of the Act will be under the Minister of Lands and Mines. A provincial forester will be in charge of the administration of scaling, enforcement of cutting regulations on Crown lands, continuation of the forest survey, forest fire protection, and the enforcement of the laws and regulations concerning fish and game. The organization of the staff is now under way.

The merit system of appointment will be strongly promoted through the appointment of a Forestry Advisory Commission, consisting of the Minister and Deputy Minister of Lands and Mines, the Provincial Forester, one prominent lumberman selected by and representing the licensees of Crown timber lands, and one other lumberman or forester associated with the ownership or management of Crown-granted forest lands. This commission will supervise appointments, which are to be based upon a practical examination, written and oral.

The provisions relative to forest fire protection are based upon the most advanced legislation in the several provinces and states. The organization will cover Crown timber lands, licensed and unlicensed, as well as the larger bodies of timber land in private ownership. A fire tax of one-half cent per acre per year is to be collected from licensees, supplemented by an allotment from the wild land tax and by an annual appropriation which will bring the Protection Fund up to \$100,000 per year.

Eagle Lumber Company Operates Busy Mills

Plants Located at Mont Laurier and St. Marguerite are Equipped with Latest Facilities—Comfortable Dwellings Built for the Employees

The Eagle Lumber Company, Limited, of Montreal, which is one of the most successful manufacturers and wholesalers in the eastern portion of the Dominion, was organized in 1906, and has been under the management of its present head, Mr. J. S. Bock, since 1912. By strict business methods, careful management and keeping up the high quality of its products, the organization has made splendid progress. For over a quarter of a century the president of the company, Mr. Bock, has been actively identified with the lumber industry, having been connected with the Papineauville Lumber Company for eighteen years as superintendent of logging and milling operations.

The company's well equipped saw mill at Mont Laurier, Que.

He has a wide insight into the trade, which has been broadened by his interest and enthusiasm.

The company owns several mills in the Laurentians on the Canadian Pacific Railway, Mont Laurier branch. It caters principally to the trade of Montreal, Toronto and the United States, in such markets as New York, Albany, and some of the towns in northern New York and Vermont.

Prior to 1916 the company exported to England a large quantity of birch and spruce, but owing to shipping restrictions has been compelled to dispose of this lumber in other markets. A large area of standing timber is held by the company to be manufactured for export as soon as conditions permit.

The Main Mill is Well Equipped

The main mill, located at Mont Laurier, which is 40 ft. x 175 ft., is one of the most modern, and is equipped with a steam feed carriage made by the E. Long Manufacturing Company, a special top circular saw equipment with Madison and Williams saw frame, a Madison & Williams re-saw, Hollow Blast Grate Company edgers, and all other machinery used in a modern sawmill. The power is supplied with two large steam engines, E. Leonard & Sons make, and four large boilers, contained in a solid concrete building a short dis-

tance from the mill. The logs are hauled from the Lievre River on a log slip and placed on the log deck by a steam kicker, then rolled on to the carriage by steam niggers. The mill is also equipped with twin saws, and the lumber after passing over the butting saws is placed automatically on an endless conveyor and carried to a large sorting table near the piling yards. It is here sorted and graded by experienced workmen. The lumber yards are very spacious and are equipped with side tracks, most of the lumber being loaded from the piles on to the cars. The shipping facilities at this point are excellent. Some of the finest spruce and birch lumber is produced at this mill, while other varieties are also turned out in large quantity.

The planing mill, located near the sawmill, is equipped with one No. 94 matcher, P. B. Yates Machine Co., a Yates re-saw, a Yates sticker, and all the necessary re-saws and trimmers. The dressed lumber is kept in large sheds alongside the railway tracks. The plant is under the management of Mr. G. Villeneuve, local manager since 1906. The company has built several comfortable dwellings for its employees.

The plant at St. Marguerite, Que., along the C. P. R. line, while not as large as the Mont Laurier mill, disposes of a good sized cut and turns out the "Eagle quality" of lumber. Spruce and birch are the principal product of this mill, but hemlock and cedar are also sawn. This plant is under the local management of Mr. R. Deslauriers. The company has contracts with several mills along this section.

All Machines Run by Individual Motors

The planing mill, which is situated at St. Jerome, near Montreal, is one of the most up-to-date plants. It is situated in a building

South section of the planing mill at St. Jerome.

80 x 160 feet. Its equipment consists of one matcher, No. 90 P. B. Yates Machine Co., a Yates 6-inch band saw, a Yates sticker, a Yates re-saw, a Yates swing saw and all the necessary re-saws and trimmers. Electric power is used at this mill, the company making its own power and every machine being equipped with its own individual motor.

The upper part of the building is used for the manufacture of

The saw mill and pile of hardwood logs of Eagle Lumber Company at St. Marguerite, Que.

packing boxes. In connection with this mill the firm owns a sash and door factory run by water power, which is equipped with the most modern machinery.

At this point the company has a large lumber yard close to the C. P. R. and C. N. R. where lumber is kept in stock to make up mixed cars and quick orders. The company also carries on a transit business and in this connection has obtained numerous customers in Montreal, Toronto and the United States. The plant is under the local management of Mr. R. Villeneuve.

In addition to the principal shareholders, Mr. J. S. Bock is president and manager, H. J. Tetreau assistant manager, and Mr. L. F. Dubreuil, secretary-treasurer. The photos are by courtesy of the latter. The general offices are situated at 90 St. James St., Montreal.

N. B. Lumbermen Won Their Point

A leading operator in New Brunswick in a letter to the "Canada Lumberman," says:—As far as the general principles of the Workmen's Compensation Act are concerned, the lumbermen were in sympathy with it and were quite willing to have their industries come under the workings of this Act. They did object to the work in the lumber woods, the driving, rafting and the running to the mills being included, and covered under the general Act. They felt and urged upon the government that accidents that might occur (and which were not very frequent on this class of work), such as the employer had no control over. Elements that entered into this did not enter into the manufacturing industries, and if it was intended that the lumber mills be taxed for this part of the work, it meant that they had to pay a percentage on the raw material that entered into their work, whereas none of the other industries were called upon to do so.

The argument that was put up by the lumbermen evidently had weight with the government as they eliminated the portion of the Act that covered woods operation, driving, rafting and running.

With regard to the Crown Land License, I understand that some of the small holders who have within recent years enlarged their mill capacity and also had operated beyond the limit of their Crown land holdings, in many cases getting more logs than their mills required, and selling the surplus, appeared before the government anxious to have portions of the lands held by large holders withdrawn from them and made available to those who had in this prodigal way used their Crown land. I do not know what weight this had with the government, but I do not see how they could interfere with the twenty-five years existing renewals, nor do I see how they could meddle with these holdings. If they decided to do so what method could be employed to decide what lands would be taken away and from whom they should be taken. I have not heard of any expression of opinion from the government, and although I asked for permission to be present while they were presenting their case to the government, they objected to my doing so, so the line of argument used by them is entirely from hearsay evidence. From what I have heard I scarcely think that they put up a strong enough plea to entitle them to any consideration.

Chapleau Firm Win Pulp Wood Suit

In the action of Austin & Nicholson, of Chapleau, vs. the Canada Steamship Lines, it was sought to recover \$15,000 damages for breach of alleged contract of the defendant company to carry 10,000 cords of pulpwood from Michipicoten Harbor to the Ontario Paper Company at Thorold, during the navigation season of 1916. In the spring of that year the price of pulpwood delivered was about \$8. Later in the season it sold at \$18 a cord. This was the statement made at the trial, in Toronto, by Percy Dobel, a lumber contract agent, who gave evidence on behalf of Austin & Nicholson. Mr. Dobel was instrumental, it was alleged, in selling Austin & Nicholson 10,000 cords of pulpwood on a basis of 2½ per cent. commission. He had promised delivery of the wood over the lines of the Canada Steamship Company. The latter had been unable, it was contended, to fill the delivering contract, and Mr. Dobel furnished evidence regarding the nature of that contract. Justice Lennox, who heard the case, said that he found that the fact of a sale to the Ontario Paper Company was immediately communicated to H. W. Cowan, at that time operating superintendent of the Canada Steamship Lines, substantially as stated by Mr. Austin, and that this was intended as a final acceptance of defendant company's proposition was so understood. The subsequent discussion of details by Mr. Nicholson and Mr. Cowan proceeded on that understanding. His lordship delivered judgment in favor of the plaintiffs for \$14,000 and costs.

Parent Company Still Responsible

A proposal was recently made in the Canadian Senate to the effect that letters patent to a joint stock company could provide for the creation of branches, and that such branches could hold property and contract debts for which the parent corporation would not be liable. The

amendment was, however, dropped, as it was pointed out that, under the present system, the parent company stood behind the financial and moral obligations of branches, and this responsibility should continue. Other amendments were, however, adopted which are of much interest to lumber and timber organizations and others. These provide that the affairs of a joint stock concern may be managed by not less than three directors, and that the location of the chief place of business of a company may be changed on a vote of two-thirds of the shareholders.

A Portable Saw that Meets Every Need

In this issue of the "Canada Lumberman" appears an interesting announcement in reference to the Vaughan Portable Gasoline Drag Saw, for which the J. G. Pennoyer Company, 226 La Salle Street, Chicago, Ill., are selling agents. The Vaughan drag saw is a simple, easily-operated, economical, and practical machine, for the use of timbermen, wood-cutters, ranchers, and others, with a cutting capacity of twenty cords in a ten-hour run. The outfit has been in successful operation for years, and is designed and constructed specially for cutting wood of any kind in any place under any condition to be found in the wood or lumber camps and in all sorts of weather. The machine is operated by one man, who moves it from cut to cut on the log, and is so light that two men can carry it anywhere. It will cut logs even where a cross-cut cannot be used, and its efficiency, strength, and compactness make it a great time, money, and labor-saver. To drive the machine the power used is a gasoline motor engine, built specially for the purpose, and the motion of the saw gear parts is through a chain on a small sprocket on the engine shaft. The frame of the Vaughan is built of well-seasoned fir, well framed and ironed to prevent wear and keep the working parts in rigid position, while another feature is the saw-holder. The saw blade can be instantly put in or taken out of the holder, the operator losing no time bothering with nuts or adjusting the saw in the holder. All working parts of the Vaughan drag saw are placed under the surface of the frame. This permits the machine to be slid over logs or placed on any ordinary wagon without the slightest danger of the parts being broken.

May Hold Convention in the West

At the recent meeting of the executive of the Canadian Lumbermen's Association, it is learned, the suggestion was made that a convention should be held in Vancouver in June, 1919. Whether or not this project is carried out will depend on the war. If peace is declared in the meantime, it is likely that the prospects of taking the gathering west will be seriously considered. All the circumstances will be taken into effect at a later date and the possibility of carrying out the plan carefully canvassed.

Another matter which was given attention was trade acceptances, the use of which has been endorsed by the National Wholesale Lumber Dealers' Association, which body met in New York a few weeks ago. In all probability a letter will be sent out to the members of the Canadian Lumbermen's Association setting forth the merit and purpose of trade acceptances. It is learned that the C.L.A. is in favor of adopting the idea of trade acceptances, and may take up the question further at a later date, after the various forms have been submitted to them and their use fully explained.

A Convenient Work of Reference

The Buffalo Forge Company, of Buffalo, N.Y., have recently issued sections 100 and 108 describing the merits, uses, and facilities of their portable and stationary forges. These forges have been on the market for forty years. The convenient booklet is well illustrated, showing forges of all kinds, of which a comprehensive description is given, including prices and other details. An innovation which will be appreciated is the renumbering of the forges. This numbering is based on the well-known Dewey decimal system, and all forges are tabulated according to their blower number. The first figure classifies the various forges under the heading of blower, the second figure according to hearth, the third the size of hearth, while the letters indicate the style of hood.

Endorses Aeroplane Forest Patrol

The feasibility of the airplane for forest fire patrol work is in a cursory way regarded as extremely plausible by Hon. T. D. Pattullo, Provincial Minister of Lands, British Columbia. His opinion regarding advantages which should be derived from the inauguration of such service was expressed in conversation, and an air service veteran, who returned after being wounded six times, furnished him the inspiration. Such returned flying men, thought the Minister, would prove invaluable to the government forestry branch for patrol work along the British Columbia coast areas. The distance they could cover in a day's run would aggregate more than three or four mounted patrolmen on terra firma, while observation from the air over forest areas would have manifold advantages over observations taken from the ground.

Big Fort Frances Mill in Full Operation

The Shevlin-Clarke Company's mills at Fort Frances, Ont., which recently resumed the cutting of logs, are among the best equipped in the Dominion. One mill has two band saws and a resaw, while the other has a band saw, a gang, and a resaw. The daily capacity is approximately 650,000 feet. The company have been manufacturing lumber since 1911, and 98 per cent. of their output is white and Norway pine, the proportion being about equal. The company have sufficient logs to keep them operating all summer, and in their yards storage facilities exist for about 100,000,000 feet of lumber. The timber supply in sight for the Shevlin-Clarke Company will last for about fifteen years. Last winter the firm operated sixteen camps, and they expect to ship well over 100,000,000 feet of lumber this year. The payroll of the concern averages \$60,000 a month, and there are at present 700 hands in the employ of the company and a number of others in the woods.

International Rate Question Considered

An important conference was held in Ottawa recently when representatives of the various railways met a delegation of lumber men from Montreal, Toronto and Ottawa to consider the tariffs recently filed by the railway companies with the Board of Railway Commissioners whereby joint international rates on lumber have been increased fifteen per cent. as against an increase on lumber rates in the United States of a maximum of only one cent per hundred pounds. The action of the railways in charging an advance of fifteen per cent. on the United States portion of a through haul was thoroughly discussed.

The question of restricting the stop-off service privileges and increasing the charge from one to two cents per hundred is yet in abeyance. The railways have decided not to limit the service as at first proposed, and, in regard to the tariff only one cent is being asked. Meanwhile matters are going on as formerly and the lumber companies paying only one cent per hundred for dressing in transit. If the railways file tariffs with the Board of Railway Commissioners seeking to double the present rate the proposition will be opposed by the Canadian Lumbermen's Association. It is reported that there is little likelihood of anything further being heard from the transportation interests and the service and rates will in that case remain unchanged.

Eastern Company Has Splendid Facilities

The Quebec Lumber Company have opened offices at 98 St. Peter Street, Quebec City, in charge of Mr. John Paradis, general manager. Mr. Paradis states that they have a dressing mill located at Point Levis, opposite Quebec City, and situated so that they have splendid facilities for rail or deep water shipment and have connection with all railroads running into Quebec City and via Quebec Bridge. The mill has a dressing capacity of ten million feet per year. Mr. Paradis declared that they always carry in stock in their yards between four and five million feet of the best spruce and hardwoods produced in the province. This lumber is obtained chiefly from the St. Lawrence Gulf ports.

Sawmill Machinery is "Movable" Property

In the Practice Court, Montreal, Mr. Justice Lamothe rendered judgment, in the case of the Agricultural Schools, in liquidation, and Georges Duclos, liquidator, and Dame Margaret Caroline McMartin et al, petitioners, and W. L. Miller & Co., misen-cause. The petition of McMartin et al was refused with costs.

The petitioners asked that a sale by auction authorized on January 11 by interlocutory judgment of Mr. Justice Archibald be annulled and the effects sold, consisting of machinery returned to their former position in the sawmill at St. Adolphe de Howard, owned by the company in liquidation. The petitioners claimed that they possessed a mortgage of \$25,000 on the sawmill in question, and that therefore the heavy machinery and equipment should not have been sold when the movable property was sold. According to their claims, such equipment as boilers, engines, planers, etc., are immovable property, forming a distinct part of the mill. The liquidator claimed that the sale had been authorized after a meeting of the inspectors to the liquidation and that the sale was legally authorized, the machinery being considered as removable property. Mr. Justice Lamothe sustained the latter view. The Miller Company's connection with the case was that of purchasers of the machinery.

Great quantities of spruce and other woods, cut from Newfoundland forests within the past four years for use as pit props in British and French collieries will be used as fuel because of lack of tonnage to transport them overseas. A small portion of the wood has been utilized in the manufacture of wood pulp. Government officials are encouraging the use of the props for fuel to help the coal situation.

The Shevlin-Clarke Company's extensive mills at Fort Frances, Ont., which have a daily cutting capacity of 650,000 feet.

What Is Doing Down in the Maritimes

A sawmill belonging to Chipman MacFarlane, near Moncton, N.B., was destroyed by fire a few days ago. Besides the mill a large quantity of logs and sawn lumber was also destroyed.

A report from Fredericton, N.B., says that W. J. Noble's and Currie's drives for the Stetson-Cutler Company on the upper St. John River reached the main river a few days ago. Conditions are said to be favorable for driving operations.

The Bathurst Lumber Company's mill at West Bathurst, N.B., and another mill owned by the same company at East Bathurst, have been put in operation. A report says that the drives in that section of the country are all coming out well.

A. O. Seaman, of Parrsboro, N.S., has purchased the timber lands and sawmill of Captain Eurias Spicer at Mahony's Brook, N.S. Mr. Seaman plans to start working this property, which has not been operated for more than thirty years and is said to contain the largest and best ship timber on the Parrsboro shore.

A brush fire at Oxford Junction, N.S., recently caused a loss of \$50,000 to the lumbermen of Nova Scotia. The fire got beyond control and destroyed a large lumber pile containing three million feet of miscellaneous timber. There was 1,500,000 feet in the pile, which was owned by Halifax lumbermen.

Lumbermen report that weather conditions have been favorable for bringing out the logs and nearly all of the drives are either out or coming satisfactorily and should arrive safely for rafting. The lumbermen acknowledge that they did not cut more than fifty per cent. of their usual cut during the winter owing to the uncertainty of conditions. The large stock which many of the mills are carrying is another thing which has caused a slowing down in operations. Rafting operations are being tied up owing to a scarcity of log drivers. The cut along the Miramichi last year aggregated 135,000,000 feet, while this year it is estimated it will be about 65,000,000.

Richard McFadgen, of Fredericton, N.B., a veteran log-scaler, went to St. John a few days ago on business in connection with this season's drive. He was formerly in the employ of the St. John Log Driving Company, with headquarters in Lincoln. During the winter months he operates in Northern Maine and New Brunswick with different lumber companies, as a scaler.

The St. John River is rapidly rising and is now several feet higher than normal. As a result all the streams are swollen and log driving is progressing favorably. The outlook is bright for a successful season in the lumber industry of the province. Owing to the fact that the cut is below normal this season lumber operators state that the quality being brought out is considerably higher than that of former years. They picked their wood carefully with the result that only sticks that are 100 per cent. perfect will be driven down provincial streams this season.

Stetson, Cutler & Company's large sawmill at Pleasant Point, N.B., began sawing operations last month. The firm have both of their large mills now running. The military service law has taken many competent workers, and as a result the output has been curtailed.

The new Workmen's Compensation Act has been passed by the New Brunswick Legislature. An amendment was introduced and finally carried that the provisions of the measure should not apply to employees who were engaged in the lumber woods, or on the river drives, and in such outside logging operations. Several of the Opposition opposed the amendment, taking the ground that the Commissioners appointed by the government had included these outside lumber operations within the scope of the Act, when making their report, and had done so after careful consideration. The lumber interests should not be allowed, they said, to influence the government to eliminate this branch of the operations from the Act. They also claimed that men who had spent months in the lumber woods, or risked their lives on the drives, should be as much entitled to compensation as were those who worked on the inside service at the mills. By this amendment, about one-third of the industries of the province would be excluded from the Act. Hon. F. J. Sweeney claimed that the commissioners appointed under the Act would have power to make recommendations covering the subject being discussed in connection with this amendment.

Lumber Outlook on the Miramichi River

The outlook for lumber operations on the Miramichi River, in New Brunswick is not bright, according to advices received from the East. The amount of logs taken out is far below the average, while the scarcity of men is everywhere in evidence. Whatever mills are in operation will be on short-time schedule, and have to wait until an adequate supply of logs is assured. The weather has been ideal for bringing out the timber, and all the drives have arrived within their rafting areas. Owing to the high rates of wages, the shortage of men, and the large stocks which the mills were already carrying, lumbermen did not go into cutting operations last winter on anything more than a 50 per

cent. basis of the usual amount taken out. Rafting operations began some time ago, but there has been great difficulty in getting men for the booms. In regard to the amount of timber cut last winter in the Miramichi district, it can safely be estimated that it will not figure above one-half of the cut for the year before. Last season the cut from all sources amounted to about 130,000,000 feet to 135,000,000 feet, while this year it is placed by some lumbermen at figures no higher than 65,000,000 feet, and perhaps 60,000,000. To contrast that with last season it is only necessary to mention that the Southwest boom alone at Millerton handled 80,000,000 feet last year.

The method of shipping still seems to be nothing more than by rail, with an occasional block boat stealing away the good pulp blocks of New Brunswick to turn into valuable pulp and paper in a foreign mill and country, while splendid industries like the Dominion pulp mill are suffering for a shortage of wood. Fortunately the new local government is taking some steps to keep down the export of rossed wood, but its effect cannot be felt until next year.

Perpetuation of Pulpwood Supply

Writing to the "Canada Lumberman," W. F. V. Atkinson, chief forester of the Spanish River Pulp and Paper Mills, Sault Ste. Marie, Ont., states: "What C. D. Howe, Ph.D., in a recent bulletin issued by the Commission of Conservation and entitled 'Forest Regeneration on Certain Cut-over Lands in Quebec,' says with regard to certain districts on the St. Maurice River, in Quebec, is subject, of course, to local conditions generally applicable to parts of the Province of Ontario. It is absolutely essential to the perpetuation of our pulpwood areas that detailed studies be made and regulations worked out after these studies, if the pulpwood is to be perpetuated for any length of time. The regulations will have to include among other plans, that of the crown securing the services of a number of forest assistants of all grades, amongst the duties of whom will be that of marking only such trees as can be properly harvested. This entails a change in methods of a radical character that it does not appear likely to be adopted for some time to come, or, at least, until after the war."

Making the Forests Fireproof

Several forest fires have already occurred in various parts of Canada this year. In practically every case the cause was traced to human hands—a tossed-away cigarette, a neglected camp fire, or similar act that at the moment appeared trifling. Settlers, anxious to burn their "slash" in the hottest weather without obeying government regulations are a prolific cause of forest fires every year.

The rangers are asking the co-operation of every man, woman and child this year so as to keep the forest losses down to a minimum as a matter of decent patriotism. Special efforts are being made to provide fire fighting equipment, but the main task is to prevent fires from starting. This is a comparatively simple matter if every camper puts out his camp fire, every smoker extinguishes his cigarette and match before tossing away, every settler guards his clearing fire. When a bush fire is seen, instant word should be sent to the nearest fire ranger, railroad agent or municipal officer.

The North is Rich in Timber

Hon. Andrew Knox, in a recent address referring to the resources of Saskatchewan, said:—"Another industry which is doing good work in Northern Saskatchewan is that of lumbering. I have been informed by the manager of a company operating at Prince Albert and Big River, that they have already got the logs and expect to cut in the neighborhood of one hundred million feet of lumber this year. This goes to show that the territory to the north, from which the logs are brought, is rich in timber and there are great possibilities for pulp factories located on almost unlimited water-powers, a fact which should be of special interest to some honorable members who have taken part in this debate. I might say in passing, that the estimated water-power of Saskatchewan is over three million horse-power, and that this is nearly all in the northern portion of which I have been speaking."

The Gregoire Lumber Corporation, Limited, has been incorporated, with a capital stock of \$45,000, for the purpose of buying, cutting and manufacturing all kinds of commercial wood; to carry on a general lumber business; to construct, own and acquire forest lands, water powers and mills; and to carry on the business of floating logs, as well as to deal in general merchandise. The principal place of business is at Plessisville. Messrs. Napoleon Gregoire, J. L. Gosselin and J. F. Forand are interested.

Captain C. H. Nicholson, manager of G. T. P. steamers, says that at Prince Rupert two electric cranes are to be placed on the new dock the company is building at the northern port. This wharf is for the purpose of handling aeroplane spruce from the Queen Charlotte Islands, and the cranes will take the lumber off the vessels and place it into the cars.

Cafeteria Plan of Serving Camp Food

Material Saving is Effected and Men are Well Pleased with the Service—Easy to Control the Amount and Quality of Supplies—Details of Operation Explained

The conservation of food and the necessity of greater production were never more in evidence than at the present time. The new regulations, which will soon be issued by the Food Controller's Department at Ottawa, with respect to the rationing of men in lumber, mining and construction camps, will make it imperative for the closest oversight to be exercised in the way of purchase, preparation and distribution. Any practical system which will materially assist in enabling timber operators to observe rigidly the requirements of the law in the matter of quantities and weights is timely and instructive. Dif-

The kitchen range, kettles and serving pans.

ferens plans have been tried and among those which seem to be meeting with a large measure of favor is that where each one helps himself or, as it is frequently known, the cafeteria system. The self-serve arrangement, it is thought, may prove of much benefit in the conservation of food in lumber and other centres and as the details are worked out, its economy, convenience and efficiency will likely be evidenced.

Whether the cafeteria method which has prevailed for some time in the Kerr Lake Mining Company's camps at Cobalt and has been conducted successfully will answer equally as well in woods operations remains to be seen. Some lumbermen think that a cafeteria will admirably fill the bill, while others hold a directly opposite view.

In order to shed as much light as possible upon the latest means of feeding men in camps, the "Canada Lumberman" got in touch with Mr. H. A. Kee, manager of the Kerr Lake Mining Company, and he has sent the following description of the service and its practical application, which will be read with interest and profit by every one connected with logging operations.

The Best Results at Lowest Cost

The problem of feeding employees in mine or other boarding houses has been seriously considered by most managements, and the only point at issue is to keep the debit balance of boarding house account as small as possible.

Naturally the more efficient and capable miners usually seek employment where they can procure the most satisfactory boarding and other accommodations.

Everybody endeavors to properly feed their employees and have them perfectly satisfied with the food served to them. Such results are often very difficult to obtain, due in part to wasteful cooking and serving, as well as poor selection and buying of various supplies, and occasionally some of the employees are most unreasonable.

Doubtless we have all studied this problem to some extent and some of us remember our early difficulties in obtaining our portions of food at mine boarding houses when our untrained speed, light weight and short reach procured for us but fair results as compared with the previously trained heavyweight opposition.

The usual method of serving food in most camp boarding houses where a large number of men are to be served is to dish up in suitable dishes, one large dish of each sort of food to about every six or eight men, and very often after the first three men have picked over and chosen their portion the remaining food in that particular dish is not inducive to good appetite. Anything left in these dishes is seldom served again, and as a result this food is either despatched to the garbage wagon or made into hash or stew, which is not always eaten.

Very often someone who has not struck his pace in the usual dash for food, finds that the other fellow with previous experience has started his meal by eating all the pie he could reach, thus leaving nothing for his fellow workmen but the cherished privilege of using the same tactics the following day, if they so desired.

Losses Mainly Due to Wanton Waste

It is generally conceded that the cash losses on all boarding house accounts are not due to the amount of food actually eaten by the employees, but invariably due to the amount of food wasted by them after the food has been cooked and served to disadvantage.

A few years ago we casually looked into the matter of cafeteria system of serving food as used in the larger cities, where excellent meals were obtained at much lower prices than could be obtained under the usual hotel service. We decided then that some modifications of this cafeteria system could be used to material advantage in mining and other camp boarding houses, as the individual service would doubtless prove more satisfactory to the employees, and at the same time eliminate considerable waste.

Since the declaration of the European war everybody has endeavored to conserve food, particularly by eliminating waste, and on April 1st, 1917, we installed in the mine boarding house at the Kerr

The serving counter and serving operation.

Lake Property, Cobalt, Ont., the cafeteria serving system in modified form. The results have been highly satisfactory, inasmuch as there have been no changes made in the cookery staff, no one has required a second serving, and not a single complaint has been made as to the quality, quantity, or serving of food three times daily to about seventy men.

This system of serving would naturally work out to much better advantage where it is necessary to serve a greater number of men, and it is interesting to note how nicely the men handle their individual trays.

Naturally, the first thing considered in procuring best results in any boarding house is to procure a neat and efficient cook, who will

continue to take an interest in his work. In this particular we have been very fortunate.

A daily report, a copy of which we enclose, is made out and signed by the cook, and filed in the office, showing supplies used each meal, giving the number of men served each meal and weight of meats and number of eggs used.

We find it much easier to control the amount and quality of supplies used under this new system and the ultimate waste is reduced to a minimum, as all food which is not used at any meal remains in perfect condition, and is served later.

The food is placed on the serving counter in large kettles and pans in full view of the men as they are being served. The food is served by the chef and his two assistants at the rate of seven men per minute.

One photograph shows the kitchen range and the size of kettles and serving pans. The other shows the serving counter and serving operation,

The men, on reaching the dining camp, form in single file, and without hurrying they walk up, on one side of the dining room, to the ticket board, where each man in his turn procures his meal ticket, on which his name and payroll number is stamped. The man places his ticket in the counter receiving-box, and then takes a 14 in. x 16 in. black japan tray with knife, fork and spoons, and is served that portion of food which he desires.

After being served he proceeds with his tray of food to his numbered place at the table, and if he leaves sugar in his cup or otherwise wastes the food served to him it is an easy matter to check him up by getting his table number and referring to the office records.

Each man eats the same clean and wholesome food after this individual service, and they are all evidently pleased with the new system of serving.

Tickets Are Punched After Every Meal

When everyone has finished eating, the assistants collect the trays with dishes and clear the tables for another meal, while the chef unlocks the ticket box and punches the tickets for that particular meal. A sample of this ticket is presented. The tickets after being punched are replaced in the ticket board under their various payroll numbers.

At the end of each period these tickets are sent to the office and the various totals deducted from the payroll. If a man is discharged or calls for his time during the period, he procures his ticket from the chef before any settlement is made at the office. Extra charge is made for more than three meals per day, as any of the men can eat all they require in three meals, and enjoy the food served to them. Our experience is that if men are allowed the privilege of eating four times a day a considerable waste and ultimate dissatisfaction on their part is the usual result.

White enamelware dishes are used, thus eliminating waste and breakage, and it was found by experiments that less bread, butter, tea, coffee and milk, were used, when all of these were placed on the table where men can help themselves.

This system of serving or modification of same will effect a material saving if installed in all lumber and mining camps, where it is found possible to use it.

Necessary food will be conserved and the men will be pleased with the service if particular pains are taken in the first installation of the system.

Such results as have been obtained by our cookery staff under this new system would recommend it, more especially to others feeding a larger number of employees.

Food Economy in the Bush

For the baking, the cook did not use the potato yeast, though he said it was quicker, but simply used the yeast cakes. Then he stated what, in his opinion, was the real great economy, says P. B. Walmsley, in "Logging." It consisted in the using up of everything. For instance, there were cakes which became stale and dry. He made these into puddings. As for the meat, he had two or three roasts, and then a stew, and what was left of a stew he would mince up and make a pie of it for supper, making a crust to go along with it. On my inquiring if he had to be careful not to have too much stew, lest it spoil, he said that was so, especially if there were vegetables in it, as then it would sour much quicker. They made it ferment.

The greatest loss was generally in meat, and that was the most costly item on the menu. A good meat cook was a useful man. He distinguished between dry cakes and moist cakes. You could make more of the dry cakes, without risk of their spoiling, as they would keep longer. The dry cakes were cookies, etc., while the others were rock cakes, etc.

There was a good deal of loss with salt pork. It would get hard, after being done up. But he had a remedy for that, and it was to drain all the fat and gravy away, and then put hot water over it. That made it nice and soft. Then a wave of reminiscence came over

SAVE FOOD AND WIN THE WAR

him, and he recalled some previous experience. In the lumber camps, the men would require to have lunches put up to eat in the bush. Some cooks would cut up great hunks of bread and meat, and the bread would get dry, and the men would throw away a lot of it, also lumps of fat. Now when he worked for a lumber company he used to prepare lunches for thirty men every day. He then made it a practice to cut them sandwiches, not too thick, and he cut the meat nice and thin, and put some mustard with it, and found there was then very little wasted.

But, as he said rather sadly (and here's a lesson for managers who will learn it), there was not much encouragement to do all this, if there were nothing extra to be got for it, for, of course, it involved a lot of extra labor. He emphasized this point. Some companies would take all a man might do for them for granted, and even then beat him down in the matter of wages. The truth was that a good man would then save the extra wages, whereas a cook who was a poor manager, even if at low wages, could soon lose the wages of another man, by what was lost in the swill pail. A man at \$80.00 per month might be cheaper in the long run than a man at \$45.00.

Going back to details and ingredients, he used lard for shortening, but in his own country he used the cheaper grades of margarine. He reckoned they were a good thing, and would not mind if they were introduced into Canada, and expected the companies would welcome it. This was before the introduction of oleo-margarine into Canada in November, 1917. For fruits, he used all sorts, apples and the dried fruits. They were using mostly raisins then. The currants were too dear. They used dried peaches, but had to give these up, as the men did not like them. He agreed that butter was a great item, but did not think that there would be any saving in buttering the bread beforehand, a practice we found economical in our own household. There would be too much labor. The men helped themselves.

Sugar being so high, I asked him if he could not limit the use of this. He said they had talked of it, but the difficulty was that there was no uniformity. One man would not take any, or only a very little, while another would make a hog of himself. Some would take almost half a cup of it. If they all took it, he could then put so much in for the lot beforehand. I understand this is done in the army, and it is sweetened for all. Another preference he had was for baking soda and cream oftartar, rather than baking powder, for some things.

Early Forest Fires Do Much Damage

Various Portions of Nova Scotia Visited and Considerable Lumber Falls Prey to the Flames

Forest fires have already done an immense amount of damage in Nova Scotia this year—more perhaps than was ever done before so early in the season. In former years, when forest fires were prevalent, they seldom became a serious menace until July or August. Brush was sometimes burned in clearings in May or June, but if brush fires occasionally spread beyond bounds they were not regarded as a menace, for they either died out of themselves or were controlled without much difficulty. But experience has taught a different lesson this year. Many disastrous fires occurred in various parts of the province during May—some of them before the month was half gone—and in many cases much greater damage was prevented by the strenuous exertions of firemen, soldiers and others; but even the good work of the fire fighters would not have saved the situation in all cases, for some of the worst and largest fires were quenched by the recent showers.

The first forest fire reported this season was at Oxford, Cumberland County, where a brush fire spread to a pile of lumber containing three million feet. The Oxford fire company was called out, with all the other help available, and after ten hours of hard work the fire was got under control and some of the piles were saved. The loss is estimated at \$50,000. This fire took place on May 11th, and at least part of the moral appears to be that it is unwise to put so much lumber in one pile unless there is absolute security against fire.

From all parts of the province come reports of destructive fires. Not only has much valuable timberland been burned over, but dozens of dwelling houses and outbuildings have been destroyed. In some cases cattle and horses were burned in the barns. At one place some sheep were burned in a pasture, and in another pasture six cows and two horses were consumed. One man in Pictou County lost his grist mill, sawmill and carding mill, besides his dwelling house and outbuildings. At Thomson Station on the International Railway, half a million feet of sawn lumber was burnt, and at another point many thousand railway ties were destroyed. Large quantities of sawn lumber are said to have been burned at other places, but the amounts were not specified. Platoons of the Jewish Legion and other soldiers stationed at Windsor, fought a fire all day on Sunday, May 19, near that town. The mayor commandeered all the automobiles obtainable to take the soldiers to the fire, and later, to carry them food. About five hundred soldiers were engaged, and it is said they saved many thousand dollars worth of property. At Aldershot, near Kentville, on the same day, the Depot Battalion fought fire all day and were able to save many buildings from destruction. In Antigonish County a historic church was destroyed, with other valuable property. Several sawmills are known to have been burned, and in each case a quantity of sawn lumber was destroyed.

Undoubtedly the greater number of these fires, if not all of them, were caused by the carelessness of fishermen and others in building fires for cooking. A case in point occurred in the vicinity of Parrsboro on a recent Sunday. Two car-loads of alleged sports, with no numbers on their cars, came into a tract of timberland on a fishing excursion. After a time the fire they had kindled spread to the surrounding trees, and they left for home without making any effort to put it out. Fortunately, some mill men were near at hand, and, with assistance obtained from outside, were able to put out the blaze.

The disastrous fires of this season came as a surprise to many, and were the result, to some extent, of unusual conditions. April and May are usually rainy months, but this year there was very little rain in April and none the first half of May. Consequently, the woods were much drier than they usually are at this season. For several years past there have been very few forest fires, and probably people have become less cautious. The appointment of Forest Rangers was believed by many to be a great protection, as they undoubtedly would have been if they had done their duty, but the experience of this year seems to convict them of utter failure.

Personal Paragraphs of Interest

George F. Ellison, one of the best known merchants of St. Thomas, Ont., died last month. He was born in St. Thomas 64 years ago and had carried on an extensive lumber and coal business in that city for over 35 years.

Hugh A. Rose, of Toronto, representing Mason, Gordon & Co., Montreal, has returned from an extended trip throughout the Maritime provinces. Building operations are not very brisk in the east and a shortage of help is reported on all sides.

D. M. Heise, who was formerly in the lumber business in Stouffville, Ont., is now sales manager of the Knight Manufacturing and Lumber Company of Meaford, Ont., who are both wholesale and retail manufacturers of hardwood interior trim and solid and veneered doors.

The company last year conducted an exclusive wholesale business, but this season are going more into the retail line and report the prospects as good.

Edward Clark & Sons, Limited, Toronto, will shortly remove their offices from the Stair building to the fifth floor of the Bank of Hamilton building, where they will occupy the commodious quarters being vacated by the freight department of the New York Central railway.

Josiah Fowler, head of the Josiah Fowler Company, St. John, N. B., passed away recently. The deceased, who had built up a wide reputation as a manufacturer of axes and tools, was one of the oldest and most respected business men in the Maritime Provinces. The firm of Josiah Fowler was established in 1865 and incorporated in 1895.

J. A. Laberge, of the Laberge Lumber Company, Sudbury, Ont., has resigned the position of secretary of the northern district of the Ontario Retail Lumber Dealers Association. He has not been feeling well for some time and desires to be relieved of his duties, although he states that he will retain an active interest in the work. A. J. Young, of North Bay, has been elected as successor to Mr. Laberge for the remainder of the year. He is widely and favorably known and has always upheld the welfare of the industry.

How Quebec Delivery Plan Works

Secretary Chalifour Explains Details in Levying of Charges on all Lumber Delivered

Writing to the "Canada Lumberman" a leading yard man in Western Ontario says: "We understand from a recent article in your publication, that the Quebec dealers charge 75c for a one-horse load and \$1.25 for a two-horse load. We would take it from that, that it would make no difference whether the customer got two thousand feet of lumber or fifty feet, they would still make this charge. This does not appear right to us. We think the man purchasing the two thousand feet of lumber should not be asked to pay anything for the delivery in the city; and then again, the man who has bought the two thousand feet may want fifty feet more to finish the contract, and are you going to charge another 75c for delivering this? It strikes us that all this should be figured in overhead, and when a man buys lumber from you at so much per thousand feet, it should be f.o.b. on the job."

In answer to the foregoing query J. O. Chalifour, secretary of the Quebec, P.Q., Retail Lumbermen's Association, says: "We are glad to learn that some lumber retailers of Ontario are anxious to get more detail about the reform we have made concerning the delivery of our lumber.

"The retailer reference in your letter is right so far as the tariff of cartage is concerned, that is, we charge 75 cents for a one-horse load and \$1.25 for a two-horse load.

"Following his argument, we find that he claims that a customer who buys 2,000 feet of lumber should not pay any delivery. We are not inclined to believe that this gentleman means what he says, because we do not think that there is one single lumber dealer who will maintain that the delivery of 2,000 feet of lumber should not be charged to the customer some way or another.

"This delivery represents from one-third to one-half day's work, and should be worth \$1.00 to \$1.50. Therefore, this amount, or whatever you consider this delivery is worth, must be charged either on the price of the lumber or at the rate of so much per load.

"The reason why we prefer charging delivery apart from lumber, is because contractors do not care how many trips we make on one day to the same job, sometimes, for altogether a small quantity of lumber; whereas when the delivery is charged so much per load, contractors figure up the quantity of lumber they will need for the whole job; hence we deliver same in full loads, which saves every time many trips, and in that way a great saving of cartage is realized.

"In other words, when the delivery of lumber is charged at the rate of so much per trip, all our customers do their best to save as many trips as possible; that is one of the important advantages of having the delivery charged apart from the lumber.

"As regards small orders, we deliver them three or four at the same trip as much as possible, and charge only one-half, one-third or one-quarter of the tariff, according to the number of deliveries we make at the same time; but whenever a customer orders just a few articles, and says that he needs them immediately, if we do not have any other order going this way, we tell him that we shall have to charge him full delivery because we must make the trip for him alone.

"All the most important lumber dealers of the city of Quebec charged the delivery apart from their lumber in the past year, and we had lately a report from each of them, stating that they were very much pleased with the improvement, and that they had no difficulty in carrying it out; we can add that the majority of our customers now understand well the new system and like it better than the old way."

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Trimmer Ends Wanted

White Pine, Red Pine and Spruce, 1917 or 1918 cut. Write stating approximately what you have. Give thickness, conditions as to color, worms, etc. Box 738, Canada Lumberman, Toronto, Ont. 10-15

WANTED Spruce Squares and Lumber

Several cars Clear and No. 1 Eastern White Spruce Squares, any size, 4 x 4 to 6 x 6 or over, 4 ft. and longer; can be shipped green from saw. Also several cars 5/8-in. or 1 1/4-in. quarter sawn; also 5/4-in. Clear and No. 1, plain sawn, Spruce Squares and Lumber.

Box 735, Canada Lumberman, Toronto, Ont. 9-12

WANTED Spruce Clapboard Hearts

Write how many carloads, lengths and f.o.b. price.

J. E. Harroun & Son
Watertown, N. Y.

Wanted-Basket Bottoms

Ten cars of Basket Bottoms in spruce, pine or other suitable soft woods in the following sizes:

16 3/4 in. x 6-7/8 in. x 7/16 in.
13 1/2 in. x 5-7/8 in. x 7/16 in.

If unable to supply as above, 1 inch re-sawn lumber in 6-inch and 7-inch widths will answer. A good grade of cull lumber will answer, but must be clear at the edges.

CANADA WOOD PRODUCTS CO.,
8-11 St. Thomas, Ont.

For Sale-Lumber

Piling

We are operating in the woods this Summer and can supply piling any size and length. Enquiries solicited.

We are in a position to supply Piling of all lengths and diameters, cut to order, in reasonable time. Write to us for prices.

DON H. JACOBI & CO.,
8-11 Haileybury, Ont.

For Sale

2 cars of 5/4 and 6/4 No. 1 and 2 Barn for dressing.
3 cars of 2 in. No. 1 and 2 Barn for dressing.
100 M. feet 2 x 4 Norway.
100 M. feet 2 x 6 Norway.
All 1917 cut.
10 cars of Cedar Posts.

Address Box 741, Canada Lumberman, Toronto. 11-11

For Sale-Machinery

Machinery For Sale

1-Jenckes Machine Co. 40 H.P. Boiler on skids, with stack, spark arrester and engine connections.
1-10 x 12 center crank engine.
1-3 saw edger and saws.
1-18 ft. 2-saw trimmer and saws.
1-2-block carriage, set works, track and rope feed.
1-Husk arbor, etc.
1-Bull wheel, shafting, etc.
1-Cut off saw and arbor.
1-Covel No. 35 automatic saw gummer.
1-Lumber car, track, miscellaneous shafting, belting, pulleys, etc.
1-Complete blacksmith outfit and two chests of tools.

All for sale, F.O.B. boat or cars Sault Ste. Marie, Ont. Will sell in block or separate items.

Address for further information:—
SHELBY BASKET COMPANY,
10-tf Shelby, Mich.

Steam Equipment For Sale

Steam Power Equipment in A1 condition, consisting of the following:

BOILER

1—Horizontal Fire Tube, Goldie & McCulloch 60 in. x 14 ft., 74 3-in. flues, 100 lbs. normal pressure.

ENGINE

1—Goldie & McCulloch "Ideal" tandem compound horizontal, style T.C. 10 in. and 16 in. x 12 in. stroke, 100 lbs. pressure, 300 r.p.m., 60 in. x 10 in. flyball governor wheel and 60 in x 12 in. belt pulley.

ADDITIONAL EQUIPMENT

1—Belt-driven Goldie & McCulloch Condenser and Pump; Horizontal Action.

1—Horizontal Feedwater Heater, Goldie & McCulloch No. 18.

1—Vertical Belt-driven Feed Pump, with loose pulley and adjustable crank.

All of the above equipment is in first class shape and was removed to make room for a sub-station of the Hydro-electric Power Commission. For further information address,

The Smith's Falls Hydro-Electric System,
11-14 Smith's Falls, Ont.

Belting For Sale

We have a large quantity of Second-Hand Rubber and Leather Belting in all sizes and plys up to 24 inches in width, which we can sell at interesting prices. Send us your requirements. N. Smith, 138 York Street, Toronto, Ont. 9-11

Spruce Cut Is Now Satisfactory

In presenting an act respecting the cutting of spruce timber for use in aeroplane construction, Hon. T. D. Pattullo, Minister of Lands for British Columbia, recently stated that airplane spruce production in the province was now fully up to the requirements of the imperial authorities. He asserted that within forty-eight hours after the passage of the provincial order-in-council providing power for cutting spruce timber on any lands in the province the work was speeded up. "The production in the province is now meeting the demands of the Imperial Munitions Board," he said.

The minister explained that up to June of last year most of the spruce from the Pacific Coast used by the allies came from Washington and Oregon, where there was a slow, but steady, increase in production. Last July the British authorities asked the provincial Department of Lands to give advice as to the best methods of arranging for production in British Columbia. This was done. Then the Imperial Government sent a representative to look into the situation, and within a short time a department of aeronautical supplies was established in Vancouver, with Major Taylor in charge. Prices, higher than the market, were fixed after a consultation between the board, the department, and a committee representing owners. There had been no complaint about prices, observed the minister, and the step which had been taken was found not only to be good for the cause of the allies, but also good for business in British Columbia. There were now several large spruce operators at work and a large number of small loggers and millmen.

Will Make Paper From Bamboo

Foreseeing a paper famine throughout the world within the next few years, the publishing house of Thomas Nelson & Son, of Edinburg, Scotland, have planted about 1,000 acres of land in Trinidad, B.W.I., in bamboo, from which they plan to manufacture paper. According to a Trinidad despatch, they have obtained a concession permitting them to cut bamboo from the government forests.

It is said that they have designed a machine which will shred, mash, and remove the knots from the bamboo, and that they have found a dye or bleach which removes the yellowish-green color from the wood pulp and makes it perfectly white.

It is understood that the machinery for the proposed plant has already been ordered, and that it will cost about \$150,000. Owing to war work, however, this will not be delivered probably while the war lasts. Meanwhile, however, the bamboo is being grown, preparatory to its eventual manufacture into paper.

New Type of Inventory

A bailiff went out to levy on the contents of a house. The inventory began in the attic and ended in the cellar. When the dining-room was reached the tally of furniture ran thus:

"One dining-room table, oak.

"One set of chairs (6), oak.

"One sideboard, oak.

"Two bottles of whiskey, full."

Then the word "full" was stricken out and replaced by "empty," and the inventory went on in a hand that straggled and lurched diagonally across the page until it closed with:

"One revolving door mat."

Review of Current Trade Conditions

Ontario

There has been no radical change in the general market situation in Ontario during the past two or three weeks. Prices still hold firm and while there are no present indications that they will ascend still there is every evidence that there will not be a drop, for some time at least. Business on the whole is spotty and uncertain. Mills which have not yet sold their cut for 1918 are not worrying over the outlook as they feel that by hanging on a reasonable length of time, they will be able to get the quotations they are asking. This applies to white pine, red pine, spruce and hemlock, as most of the hardwoods are sold up and dry stock is very scarce. One inch basswood is commanding a premium. Wholesalers are buying a little more freely than they were and as the season advances have more confidence in the stability of the market. However, it is not likely that there will be any definite change until well on in June, when it will be known more fully how labor conditions are, how production is coming along and whether all drives of logs have reached the mills. Labor conditions are none too promising and the recent military service act has taken a number of men from the mills. In one plant up north the police entered and commanded the edgemen, trimmers and other skilled labor, with the result that the mill had to close down a few days in order to get other help. The proprietors think this is rushing things a little too rapidly as they would have appreciated some notice of the action taken. A number of mills are not operating to full capacity by reason of the decreased cut and the shortage of help. Manufacturers contend that they must obtain the present high prices in order to break even with the game, as operating costs, wages, supplies and other accessories are so high that the finished product has to bring from 20 to 50 per cent. more than a year ago. If the war continues it is believed that conditions will steadily grow worse.

The one ray of hope in the situation is that shipping facilities are now at their very best. There is an abundance of cars and all delayed deliveries are being pretty well cleaned up. This is attributed as the principal reasons for the dullness in retail yards. Dealers are not buying, first owing to the limited building undertakings, and secondly because they have had so many loads of material dumped in on them within the past month that their yards are full and the prospect of immediate release of the heavy stocks is not very bright. With such conditions confronting them, the retail business is in an unusually quiet state and is likely to remain so until well on in the summer. Furniture factories, agricultural implement works, piano and gramophone industries are well employed, which results in active requisitions for all kinds of hardwoods. Some lines, particularly oak and ash are scarce.

From time to time reports are received to the effect that the American government has under consideration the regulation of all lumber prices in the United States. If such a move is made this will naturally have an effect on the business of Canadian firms shipping to the United States. No confirmation of the report has, however, been received up to the time of going to press, although it is well known that the matter is under advisement. There may be facilities opened up in the near future for a much larger export business to the United States and possibly to Great Britain. Reports received from Buffalo and other neighboring Canadian cities are that business is very fair, especially on government requirements. The embargoes to points east of Buffalo are still on, but will likely be removed in the near future. The demand for B. C. products is quiet at present as heavy orders were placed before the recent increase in prices and advantage is being taken on the transitory period to rush forward shipments and have everything well cleaned up when business revives. Building operations in some towns are improving. There is an urgent demand for workmen's houses in many cities and a few municipalities are undertaking to father housing plans. The one deterrent to activity is the present high cost of labor and material which makes the average contractor and speculative builder hesitate as he feels that he possibly can never get an adequate rental to repay him for his outlay or that values will tumble after the war and he may not be able to realize only from 75 to 80 per cent of what he has invested in the undertaking.

Eastern Canada

No noticeable change in conditions is reported in the east. The only market that can be depended upon is the Eastern States as there are practically no shipments to Great Britain with the exception of a small quantity of timber for government requirements. The labor situation is a serious one and the mills in Quebec and New Brunswick

are finding it rather difficult to secure sufficient men. Halifax is not being rebuilt very rapidly. The drives on the whole have had good water conditions and will likely reach their destination in due time, but the cut is not sufficient to keep every plant going fully. Irregular deliveries have caused some shutdowns in the Ottawa plants. The water is receding. There is some talk in the Capital of the government confining building operations to extensions to munition plants, airplane factories and other similar industries. This would shut out all additions to industrial concerns who do not in some way cater to the government's requirements. The reason for this rather radical move is said to be the necessity of keeping all unnecessary structural work down to the limit and releasing as many men as possible for military service. Transportation is greatly improved. The logs in the St. John river are bringing the highest prices ever known, and reports state that spruce deal logs are commanding \$20 per M feet and spruce battens \$17. Spruce pulpwood and fir logs of all kinds are bringing about \$15 per thousand. One reason for this lively competition has been the activity of some mills, who owing to restricted cuts, are in the market to purchase logs. They have been bidding against one another and the result, in the minds of casual observers is that higher prices are being paid than the owners will ever be able to realize on them.

Log driving conditions are reported very satisfactory on the Penobscot, although the water is a bit low. The early rains were absorbed by the earth to such an extent that the rivers and streams were not filled as usual in the spring. Log drivers are now paid from \$3 to \$3.50 a day and board. One company is paying \$4. Contrary to its usual practice the Great Northern Paper Company will not cut pulpwood on its Maine land during the coming summer months. Fred A. Gilbert, manager of the spruce wood department of the company, says that on account of the fact that the company has a large reserve stock on hand, because it is deemed advisable to release labor that may be employed on the farms to produce food and help win the war, also because of the fact there is extreme competition among pulpwood companies for labor in the summer, it has been decided not to start operations until next September. Transportation difficulties between points in Canada are decreasing, and those dealers with locations in the New Brunswick spruce country are delighted. All spruce manufacturers in this section, however, are having all the business they can manage.

United States

The activities of the government in the regulation of prices and corraling of material are the outstanding features in connection with lumber trade conditions on the other side of the border. The authorities have been stepping in and saying what shall be sold and what shall not be sold. Naturally the market has been a sellers one and buyers must remain content to take whatever is offered them. The shortage of labor is growing more acute and as the Military Service Act extends in its operation and application, there will be ultimately lessened production. In white pine there is a good demand for industrial purposes, but the yard trade is rather quiet. Prices are quite firm. Hemlock is in good requisition in the east and the government has fixed the price of Pennsylvania hemlock at \$31 f.o.b. Philadelphia to prevail until August 8. Prices are firm in both east and west for spruce, and on the Pacific Coast airplane spruce is being produced at the rate of 10,000,000 feet a month. Markets for the side cut are gradually opening up. In Southern pine there has been a falling off which is due more to lack of stock than to anything else. There are a number of mills who have little stock to sell. Retailers have not been buying heavy, and with the car situation in excellent shape are disposed to wait until a little later in the season. There is a good demand for hardwoods in the east while in the west and south there is plenty of business, the bulk of it being with the government or for firms that have government orders. Dry stocks are low. Increase in wages of employees is going on steadily, and there is an evident decreasing efficiency on the part of the new recruits. It is said that the negroes get so prosperous in a few days, owing to the big money which they receive, that they will not work until they are down to their last dime. While the market for hardwoods is exceptionally good, there are many troubles to offset the consolation of pleasing prices and an active demand. Among these are high cost of maintenance, labor shortage and lessened efficiency.

The most important happenings in the lumber world were the meeting in Chicago of lumbermen from all sections of the country and their candid and frank discussions of the problems of the trade and

B. P. BOLE, Pres. F. H. Goff, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

the steps that should be taken to meet them, says "The American Lumberman." At one of the meetings it was announced that the Supreme Court of the United States had rendered a decision in the Mitchell-Doyle case in which it was stated that standing timber should be considered at its market value. The importance of this decision is two-fold; in the first place it may have a great deal to do with the method in which the income tax is to be figured as far as manufacturing lumbermen are concerned; in the second place, should this principle be recognized in case the government fixes the price of lumber to all buyers it would have a considerable effect, increasing the price basis several dollars. Perhaps the government will fix the price, perhaps not.

England

There is no change in the hardwood and mahogany outlook, and current supplies remain about the same. Uncertainty as to what will happen with regard to future imports in view of the alterations in the importing regulations is gradually hardening into the belief that the present moderate scale of importing will be seriously cut down. That would appear to be the most probable result of the new restrictions as regards the immediate future, however the situation may develop later on. This view is reflected by the market, which has become firmer for all descriptions of imported stock. Any addition on top of the high prices already reached is regrettable, but in face of the high landed cost of new goods advances are unavoidable. The difficulty later on may lie more in the direction of obtaining the requisite supplies than in the question of values. The demand continues to be

satisfactory, but it is very difficult, or, rather, next to impossible, to gauge its movement. This is due to the special utilization of much of the import to-day, and to the fact that the consumption is to a large extent drifting into new channels. This altered character of the consumption has placed the operator more in the dark than in normal times when demand and supply followed their accustomed course.

Practically all interest is centred on future trading prospects. These, of course, are bound up with the framing of the new regulations of the Controller. Until the new methods come into operation business will necessarily be at a standstill, as no fresh obligations are likely to be entered into during the transition period. As regards native timber trading, the advantage possessed by the country mills limits the importance of the business possible at such timber centres as Liverpool. At the same time many local operators are pushing forward their interests in keen fashion. Their output is on an ascending scale, and in spite of the discouragement mentioned they are looking forward to handling considerable quantities of wood during the summer.

The labor question naturally assumed added importance when the age limit of military service was raised, and the exemptions for the younger men were withdrawn. The course that the authorities will take in regard to labor now engaged in the development of the English timber industry is a matter of vital importance, not only to those who have invested capital in the business, but to the country at large, which has urgent need of the timber.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Prices Remain Firm in the Ottawa District

Despite a variety of disturbing influences the Ottawa lumber market during the closing period of May remained absolutely firm as to price. Reports from the majority of sources as reflecting the general situation were that things had a rock bottom.

Export inquiries, orders and sales generally declined. Transportation for shipment by rail showed considerable improvement. More equipment became available, and stock, while certain grades are still being shipped in any kind of cars generally, began to move much more freely. Only a few shipments were forwarded over the water routes. Shippers using the latter generally expect that there will be fewer barges from American ports available this season. One report in circulation in the trade was that the United States Government had commandeered a number of barges operating on U. S. canals.

Transportation facilities had apparently little to do with the decline in orders, inquiries and shipments. It appeared obvious from more than one source that the Canadian lumbermen were not going to drop their prices to a level which it is reported American lumbermen have done.

The "Canada Lumberman" learns that the prices and rate set by the United States Government on certain grades are a great deal too low to warrant Canadian competition for the stocks in question. The past cost of production, coupled with the unfavorable outlook for next season's woods operations, and the existing shortage of available dry stock do not justify lumbermen in lowering present prices.

As an instance, Gilmour & Company, who have a large export trade to the United States, pointed out that a quotation of \$40 per M. for spruce, 1 x 3 up to 8 in. (rumored to have been set in U. S.) is not one that under present conditions should attract or offer profit to Canadian lumbermen. On four-inch spruce the quotation given by Gilmour and Company was \$38 per M., five-inch \$40, six-inch \$43, and seven and eight-inch upwards.

On account of the intermittent regulation of prices, it may be that American yards and buyers are hesitating to purchase stocks from Canada fearing that they may be commandeered, at a lower figure than the original purchase price. If a price is set in the United States for 8-inch spruce at \$40 per M. and the American buyer cannot get it in Canada for less than \$43, the holder seemingly takes the risk of losing \$3. per M. in the event of his stock being over, by the American Government. At Ottawa it was not felt that there was much danger of such a happening. If it does take place it is believed that the United States Government would have at least to pay the holder of the lumber the same figure at which he purchased it in Canada, plus freight charges.

The immediate and most important concern of the lumbermen in

the Ottawa district was higher water to float the logs and get them to the mills. The rainfall in the Ottawa Valley during May was very light and caused some apprehension. The production of Ottawa Valley sawmills will in all probability be considerably lessened this year.

Dry stock in all grades became scarcer. The labor situation showed no general change. One report was current from a trade source that the Imperial Munitions Board was to let contracts for 2,000,000 shell boxes some time between June 15th and July 1st. Official confirmation was lacking.

Gordon Edwards reports that foreign orders with W. C. Edwards continue to keep up well. Though most of the Edwards Company's logs come by the Gatineau River route the lack of rain and high water began to hinder booming operations. The plant completed the last of its shell box order during early May. About fifty employees were released. The labor situation at both the Ottawa and Rockland mills was characterized as fair and the transportation outlook was characterized as being good. In reference to low water, Mr. Edwards said: "While it has not yet seriously hurt us, it is not doing us any good."

Reports from John R. Booth reveal little or no change as compared with the two preceding weeks. The sawmill did not operate up to capacity and for this reason the shortage of logs coming down the Ottawa was not so greatly felt. No shortage of sawmill labor was reported.

Shepard and Morse state that there is considerable difficulty in securing sufficient logs to run its sawmill. Shutdowns amounting to about one day per week were reported. The employees of the mill, Mr. P. C. Walker thought, would not long remain satisfied with the practice of being laid off intermittently, and believed that shortly the mill would have to close for a couple of weeks to permit a "bank" of logs being stored.

Sawing operations at Fort Coulogne were reported as being satisfactory by James Davidson's Sons. Low water conditions are not affecting the operation of the mill. A sufficient number of logs for immediate requirements are in sight. An increase in the demand for doors was noted during May. There was little demand for sash, while a fair amount of orders were received for commercial boxes.

M. C. Neate Lumber Company say that satisfactory progress is being made on their latest shell box order, which will be finished early in June.

McAuliffe-Davis reported a slow retail demand. The intermittent working of employees on shell boxes caused some bother. The mill labor situation generally was not altogether satisfactory. Mr. Davis attributed the intermittent working to the fact that employees were receiving higher wages and worked fewer hours.

The men will welcome this fresh milk every day

Klim in camp makes possible fresh separated milk every day for cooking and for tea and coffee. Klim is pasteurized separated milk in powder form. Nothing is taken away except the water, nothing at all is added. All the casein, all the albumen, all the sugar and salts of milk. Dissolved in water according to directions, it makes a liquid with the natural milk taste.

Klim is the most convenient form for supplying the milk needs of your camp. There is no waste;

the exact quantity needed can be taken from the tin without affecting the remainder. Kept in a dry place, Klim remains good indefinitely. It will not freeze in cold weather nor sour in hot.

Klim will save you money. It costs less than fresh liquid milk or evaporated or condensed milk. It is lighter to handle, requires less storage space; is easier and cheaper to transport and more satisfactory when used.

Order Klim with your other food supplies.

How Outlook is Viewed in Montreal

In discussing present market conditions and the future outlook with Montreal wholesalers, two views stand out. One group of lumbermen are of opinion that the prices asked by the manufacturers are extravagant—that it is dangerous to purchase heavily at the advances asked by the mills—ranging up to \$14.00 per 1000 on spruce—and that the demand for lumber does not and will not justify what in their view amounts to a game of speculation. It is known that some of the wholesalers who hold this opinion have declined to buy cuts at the quotation prices. On the other hand, there are those who are optimistic as to the future, and they have backed up their opinions by purchasing freely. It is pointed out that the increase is justified by the enhanced cost of production, that the demand for the United States is likely to be increased, that much lumber at the higher values has been sold across the line, and that under these circumstances, prices are practically certain to further advance. The new cut, too, will be restricted, and this will more than offset any

Business is slow, both for local and United States account, lessened demand in Canada.

The general woodworking industry is dull. There is a fair amount of business in furniture, but the shell and commercial box makers are, taken as a class, very quiet. The number producing for the Imperial Munitions Board is down to five, two having recently received good contracts. One firm is also making shell boxes for the American government. Some manufacturers have been unable to obtain further orders owing to inability to meet the prices which have lately been ruling. The demand for shell box lumber, spruce and birch, has in consequence, considerably diminished. The attempt to obtain a standard price from the Imperial Munitions Board was a failure, and those who organized the interview with the Board do not conceal their dissatisfaction, not so much at the decision of the Board, as at the cutting of rates by manufacturers anxious to secure business. It is asserted that recent prices, although higher than were formerly paid, are below actual cost as figured out by a number of firms, and that there is no prospect of securing better rates unless some arrangement can be come to by which manufacturers will decline to tender at prices which are near the danger point. Certain box-makers, however, have declared that they will not be parties to any agreement, and will continue to tend on any basis they will secure orders.

There is nothing doing in exports to the United Kingdom except for some shipments of timber on government account. It is probable that the government shipments will increase in the near future,

Conditions About the Same in St. John

While three companies are manufacturing logs at St. John it cannot be said that the market has improved in the last two weeks, in fact, if anything it seems somewhat weaker. The only market which the Canadian stocks can depend on is the American market. The seems at the present date to have slightly weakened, although a few concerns are buying to some degree, and paying fair prices. All that can be said of the market is that it is spotty, changing from day to day. The mills that are sawing are piling up their product with the hopes that some one sooner or later will buy their output at a price to show a profit. Logs are coming forward in a fair manner. Most of the drives have had good water until the last week, when it has begun to drop and is now going down fast. Unless rain comes it will make very hard driving in the main river, although the only drive known to have "hung" was a portion of Murray & Gregory, Limited, about 400M feet held up in the Qulantic, a stream in Maine running into the St. John, well up river. These logs will hardly come out this year.

The logs on the lower St. John are all out of the streams and being rafted and delivered to St. John, where they are bringing the highest prices ever paid, viz., spruce deal logs \$20 per M feet, spruce battens \$17, spruce pulpwood logs and fir logs of all kinds about \$15 per M. The cut of lower river logs is only a normal one. The cause for the high prices is the bidding by mills who have no logs to saw and are gambling that prices will be higher later on when the stocks are sawn.

Local business shows no change. The factories are busy with what small number of hands they can find, as men are very scarce who are at all able to do factory work. All factory prices are very firm. Both rough pine and Douglas fir are advancing, the pine on account of scarcity and the Douglas fir on account of the advance in the freight rate from St. John to Vancouver. Low grade stocks of refuse are moving freely with prices firm. Laths and shingles remain unchanged.

Handy Book for Youthful Builders

"The Boy's Own Builder" is a neat and instructive booklet, suitably illustrated and issued by the Arkansas Soft Pine Bureau of Little Rock, Ark. It tells the average lad how to make boats, bird houses, kites, sleds, bookcases and many other things. Specific directions are given and numerous designs presented that are helpful and interesting.

Two Worthy Sons Now at the Helm

The historic business founded by the late Alderman James Davidson, of Ottawa, which is one of the biggest woodworking plants in the Dominion and has operated for some years past under the title of Estate of James Davidson, is now known as James Davidson's Sons. The plant, covering almost an entire block, has come up from a comparatively small start to its present large proportions. The two young men who are now directing its policy and operations are Grant P. Davidson and his brother, Lieut. Keith Davidson, R.A.F. Grant

Grant P. Davidson, Ottawa.

Lieut. Keith Davidson, Ottawa.

P. Davidson has been at the head of the business for some years, but Lieut. Keith Davidson has returned overseas, leaving last month. He was granted a furlough some time ago in order to attend to important business matters and to wind up the estate, owing to his attaining his majority. According to the will of the father, who was for many years chairman of the Board of Works of Ottawa and one of the leading and most enterprising citizens of the Capital, each son receives a half-interest in the business. The firm operate a sawmill at Davidson, P.Q., and, in addition to many specialties, manufacture boxes, refrigerators, and portable houses.

Clearing More Land for Production

Settlers' permits at the rate of about one hundred per week for burning slash have been issued by the Lower Ottawa Forest Fire Protective Association. Altogether up to May this year one thousand of such permits had been granted.

About two hundred men as rangers and workmen have been employed to watch over some thirty thousand square miles of timber and pulpwood lands. Though the season is reported as not being an unusual one, twenty-five fires have been discovered and put out with little damage resulting.

Six power patrol boats have been added to the fire fighting force. They are situated at the following points: Back Lake, Kippewa Lake, Ostoboning Lake, Quinz Lake, Keneojevis River and Harricane River. In addition to these six boats two new gasoline fire fighting pumps have been ordered.

Newsy Happenings in the West

James Whalen, President of the Port Arthur Shipping Company, recently paid a visit to Vancouver, where he was the guest of his brothers. In company with George Seaman, manager of the Empire Pulp and Paper Company at Swanson Bay he made an inspection of the pulp plants and evinced special interest in the new mill at Port Alice, which will be open for operation in July next. Mr. Seaman, who is manager of the Swanson Bay plant, located 112 miles south of Prince Rupert, said that the company is busily turning out airplane spruce. About 100,000 feet of spruce per day is going through, of which from 10,000 to 15,000 feet is intended for airplane work. Six hundred employees are on the Swanson Bay payroll, and the town which has sprung up to accommodate the employees has already been given the title "the spotless town of British Columbia," because it is a model of convenience, cleanliness and comfort. In the paper mills approximately forty tons of pulp is being turned out each day, being shipped for the greater part to the Orient and the United States.

With the lifting of the ban prohibiting the construction of wooden ships on the coast for other than the Imperial or Canadian Governments the principal drawback to the development of shipbuilding in British Columbia has been removed. Efforts were made by the wooden shipbuilding interests to have this construction embargo raised immediately it became known that no more wooden steamships would be placed on the coast through the Imperial Munitions Board for the British Government, and in view of the representations made, the authorities at Ottawa, it is understood, have now notified the shipbuilding interests that the embargo has been suspended, thus permitting the coast yards to go ahead and contract with allied or neutral countries for the construction of wooden tonnage.

Jeffrey Square Shank Pin

"Hercules" Combination Malleable Iron and Steel Chain

Rivet Pin

Coupling Pin

Here are Some Advantages of the Jeffrey Square Shank Pin Construction:

The hard, smooth steel pins with the SQUARE SHANKS fit into perfectly SQUARE HOLES. The bearing surface is the FULL WIDTH of the pin. There is no rocking motion in the side bar.

The solid cast link is made of high-grade malleable iron, both for strength and durability. The long barrel provides extra wearing surface on the pin and the sprocket wheel.

Steel Side Bars are of high carbon steel—and interchangeable.

The Square Shank Pins are made as rivet or coupling pins.

The Jeffrey Square Shank "Hercules" Chain is a most economical and substantial chain for service in handling gritty materials and for heavy duty Elevators and Conveyers.

"Hercules" Chains may be used over standard detachable chain sprocket wheels as follows:—

102-B on 95-J	132 on 122
111 on 108	188 on 88
131 on 103	

We are the originators of this type of Chain and have been building and improving it for 25 years. Write for our Chain Catalog No. 211-6.

Accounting Essentials for the Trade

How to Secure an Accurate Determination of Cost of
Mill Products—The Necessity of Details

By C. H. Scovell, Boston, Mass.

Every business man or manufacturer agrees that he needs some accounting. For example, the custom is universal of keeping accounts for sales to customers and collections, and for amounts due on payrolls and purchase invoices. To emphasize these external accounts corresponds with the human instincts to collect what is due and to pay only for value received.

The next step in accounting on which there is substantial agreement as to general principles, but not as to details or methods, may be described as accounting for property owned. In your business that means for standing timber and land values, for all that you own in logging and sawmill equipment, and your inventories of logs and lumber. It is essential for any business to know what property is owned from which the debts or liabilities of the business may be paid. It is the annual or semi-annual reckoning of this kind that tells you whether your business is solvent, and by comparison with a similar statement six months or one year previous (including a reckoning of dividends, if any have been paid), whether you are making money. Just now an accurate statement of assets is of special importance in calculating invested capital in connection with the so-called excess profits taxes.

This accounting for property cannot go into much detail, however, without taking account of the costs of conversion, from raw material to finished product. This is the domain of cost accounting, and here, unfortunately, there is no agreement among lumber manufacturers, although some other groups of manufacturers have made considerable progress on this important matter.

For the joint consideration of a group of manufacturers, and especially for co-operative action, attention must, indeed, be fixed on the essentials for the industry. As to details, there might be disputes or misunderstandings, although details are frequently of great importance to the success of an individual operation.

Stumpage Cost

Accounting for the manufacture of lumber, unlike the accounting for most other manufacturing, is beset with difficulties as to the cost of raw material. Mr. Kellogg, in his excellent little manual on the lumber industry, says that "how standing timber shall be entered in the cost record is the source of more discussion than any other phase of operation."

Unfortunately there are two more or less opposed views in regard to stumpage that get expression in lumber operating, and, therefore, in lumber accounting. The attention of a manufacturer is naturally fixed on the cost of stumpage as it is consumed in lumber operations. This cost may be a current purchase price, or it may be the final reckoning of a long holding of timber. If timber has been long held there is naturally a comparison of the cost-to-date with the actual or possible prices for current purchases. There is then the debate as to how the cost of carrying timber holding should be reckoned.

The viewpoint of the holder of timberland necessarily regards the sawmill chiefly as the best method of disposing of stumpage. Even this point of view cannot ignore the cost to carry timber holdings.

I am surprised that most of the printed matter now available should be so vague and uncertain on these important matters. It seems to be the problem of raw material cost for lumber operations is different in degree only, and not different in principle from the problem of any other raw material that is bought long in advance of its expected use, and might perhaps be bought cheaper in a spot market, if, indeed, it is obtainable, when the day for consumption arrives.

It is not open to debate that there is a cost to carry raw material for taxes, all the risks of damage or loss, and interest on the investment. The misunderstandings and differences of opinion arise through the confusion of cost and value. If this is once cleared away I believe the two opposing views can be readily reconciled.

The stumpage has cost a very definite sum—on a certain date, a purchase price, if recently bought, or if purchased long ago. This cost may be more or less than the current market price. If the stumpage is worth more than it cost there is a profit from the timber deal, otherwise not. But the timber deal of long ago was made in anticipation of a sawmill operation, and it may be that the sawmill was possible only when a large timber tract was secured. In other words, it may be that the timber-holding and the sawmill operations are not considered separately in practice, or in the minds of the owners and operators.

Use of Market Price

On many individual operations it does not make any particular difference whether the business of purchasing and selling timber is regarded separately from the operation of a sawmill. It does make a difference, however, when a mill is operating partly with purchased logs and partly with its own stumpage.

It also makes some difference when a mill is operating with sev-

MONTREAL

CANADA

eral different lots of stumpage. There is a decided gain for many operators, no disadvantage for anyone, and a great gain for the common good of the industry of the current market price of stumpage, or its fair equivalent, is taken as the charge for stumpage consumed.

The purchased land may have a value after the timber has been cut off. When this is the case the cost of stumpage may be reduced, and the timber operator becomes a real estate operator.

On a lumbering operation conducted under these circumstances it may be advisable to take account of the increasing value of the uncut land. This is a problem similar to that which arises in connection with the increasing value of stumpage. If increased values of either kind are taken up in the accounts they should be clearly designated as not available for immediate distribution.

Operating Costs

Having determined on a plan for charging stumpage we naturally come to a consideration of actual lumber manufacturing costs. Fortunately for the purpose of a uniform counting plan the manufacture of lumber proceeds through a few well-defined subdivisions, namely:

Logging, transportation, sawmill operating, planing mill, by-products manufacture, selling and shipping.

The expenditures for these few main divisions should be kept separate, and the totals in these groups should be still further divided as may be necessary or desirable on individual operations.

Logging expense includes road-making, camp-building, and all expenses in the woods up to and including loading logs on cars, or perhaps on some operations, delivery to the landings from which the logs are subsequently to be hauled by teams.

A subdivision of logging expense that may well be taken account of, especially on large operations, is the building of branch railroads or permanent camps. These costs are properly chargeable over relatively long periods of operation, and should in the meantime be carried as a temporary asset under a general classification of "deferred charges to operations."

Transportation, as the second main group of operating expense, covers all the costs of moving logs from the woods landings to the mill pond. Transportation, when done by the lumber company, requires a considerable investment in equipment, and the cost, when accurately determined, must include depreciation at a fair rate, as well as interest on investment, taxes, repairs, and all other transportation charges.

On large operations there is an opportunity for considerable judgment as to the classification of trackage between main line and branches. It is assumed that the branches will be torn up, and all the costs required to lay them down should be applied against the logging operations which have been done with them. A main line track necessarily has a longer life and may ultimately be converted into a regular carrier or be dismantled like the branch lines above referred to. It is the distinction between the two classes of trackage which requires the exercise of careful judgment.

Sawmill operating, as the third main group of operating expenses, includes all costs of manufacturing from unloading logs into the pond to the placing of the lumber in piles. There is considerable more opportunity for the discriminating subdivision of sawmill costs than in any other group of lumber manufacture. Different kinds of operations will require, or at least can use, different kinds of information to good advantage.

If a planing mill is operated, certainly if it is working on a variety of hardwoods and making different kinds of trim and finish, it should have its costs distinctly set off from sawmill operating.

Shipping, as the fourth main group of operating expenses, includes all the costs of moving lumber from piles to cars preparatory to shipment. The subdivision of expenses beyond the actual sawmill will depend a great deal on the way the business is run, and whether a dry kiln or a planing mill is operated.

Overhead Costs

The most important problem in cost accounting for lumber manufacturing, as in any other cost accounting, is the analysis and distribution of overhead costs. In the lumber industry particularly it is important to recognize clearly the different groups of investment, chiefly (1) stumpage or timber lands; (2) transportation equipment; (3) sawmill building and equipment.

Mention has already been made of the importance of keeping an accurate record of the stumpage or timber investment for the purpose of reckoning its cost to date and of the investment in transportation equipment for the purpose of reckoning accurately the operating costs and depreciation. The sawmill also represents a substantial investment on which the depreciation should be reckoned. In this connection it should be pointed out that there is an additional reason as a practical matter to reckon interest on the investment in sawmill equipment, in the case of a business which has already reckoned interest on its investment in other kinds of assets.

EDGINGS

Ontario

The partnership of Mitchell & Graham, planing mill operators, at Rodney, Ont., has been dissolved.

The offices of the Collins Inlet Lumber Company have been removed from 311 Kent Building to 1109 Temple Building, Toronto.

It is probable that a shipbuilding plant may be established at Port Arthur by the Globe Shipbuilding Company, of Superior, Wis., one of the Davidson-Smith companies.

The offices of the Union Lumber Company, Dominion Bank Building, Toronto, have been extended and now occupy double the former space. The officers of the company have most commodious private offices, which have been attractively furnished.

D. H. Gillies Company, 288 Adelaide Street, London, Ont., who are erecting a sawmill to take the place of the one which was recently destroyed by fire have awarded the contract to James Moran & Sons, 937 Maitland Street. The building will be one storey, frame construction, concrete foundation, and composition roofing. The boiler, engine and equipment have been purchased.

Controllor John O'Neill says that the housing situation in Toronto threatens to become serious unless there is some attempt made to meet the demand for small dwellings of the description required for people unable to pay large rents. He hints at the possibility of the city being compelled to go into the building business after other means have been tried to induce builders to cope with the situation.

Fire, believed to have been due to a careless smoker, attacked the lumber yards of McLachlin Brothers, at Arnprior recently, and destroyed 100 piles, estimated to contain 2,000,000 feet of rough lumber, before it was brought under control by the company's fire brigade, assisted by the town firemen and a detachment from the Gillies Bros. at Braeside. The loss is estimated at between \$75,000 and \$100,000, fully covered by insurance.

Hon. G. Howard Ferguson, Minister of Lands, Forests and Mines, recently returned from an extended visit to the Kapuskasing soldier settlement in Northern Ontario. He is well pleased with the progress which the plan has made since it was launched about a year ago. The men at work in the clearing-camps and the Monteith Training Farm were visited. The returned veterans were found to be happy and well pleased with their lot in the hinterland of Ontario.

A large wooden freighter, built by the Great Lakes Dredging Company, was recently launched at Fort William. The work on the boat started in September last and it is 264 feet long, 43 feet beam and 23 feet moulded depth. The freighter has a capacity of 2,800 tons and is equipped with wireless. The hull is all wood. The ship will ply in salt water, trading between British ports. As soon as this vessel is completed the construction of a second ocean-going freighter of similar dimensions will be begun.

W. K. Jackson, President of the New Ontario Colonization Company, Jacksonboro, Ont., who get out large quantities of pulp wood, reports that the car situation is greatly improved and shipments are now going forward more freely. He is of the opinion that pulp wood will be in real demand before next winter. Very little will be taken out during the summer owing to the scarcity of labor, while the help problem for next winter is far from bright. Mr. Jackson does not believe that the pulp mills, who get out a large portion of their own wood, secured during the past season more than sixty-five per cent. of their requirements. The winter season was very short, cutting off the supply and leaving more or less in the woods that could not be hauled out to the streams or railways because of the early break up.

Eastern Canada

Rain recently put out the forest fires in Hants County, Nova Scotia.

The lumber mill and woodworking plant belonging to J. C. Hayes, Bath, N.B., was recently completely destroyed by fire.

Fire recently broke out in the shipyards of J. Coughlin and Sons, at False Creek, B.C., and did damage to the extent of over a million dollars.

S. H. White & Company, Sussex, N.B., recently lost their sawmill, etc., at Forest Glen, N.B., by fire. The loss is estimated at \$20,000, and is covered by insurance.

The sawmill and contents belonging to David Sheppard, Bear River, P.E.I., was recently destroyed by fire. The loss amounts to about \$1,000, and there is no insurance.

A charter has been granted to the Argyle Shipbuilding Company, with headquarters at Yarmouth, N.S. The capital stock of the organization is forty-five thousand dollars.

The Riordon Pulp & Paper Company, 355 Beaver Hall Square, Montreal, P.Q., are making favorable progress with their sulphite mill, power development, plans, etc., at Temiskaming, Ont.

On the Parrshoro Shore within a radius of about forty miles, eight large schooners are under construction. This is the largest number of vessels being built at the same time in that locality for more than a score of years.

A portion of the lumber piled in the yard of the Jas. Shearer Company, Limited, wholesale lumber dealers and box manufacturers, Montreal, was destroyed and damaged by a fire which started in the yards of the George Hall Coal Company, Wellington Basin.

It is reported that a number of Yarmouthians are interesting themselves in a new shipbuilding company to operate in Tusket. It will be known as the Argyle Shipbuilding Company, and will probably open in the yards at the point which, years ago, were occupied by the Hatfields.

The Quebec-Saguenay Pulp Company, Limited, has been incorporated with a capital stock of \$779,990, to carry on the business of manufacturers and dealers in lumber, timber, logs, pulpwood and pulp; to acquire timber limits,

water powers, river and driving rights, etc.; to build and maintain lumber, pulp and paper mills; to operate power plants and distribute the power in the district of Quebec and Chicoutimi. The principal place of business is St. Amédée-de-Peribonka, P.Q.

The mills of the Bathurst Lumber Company at West Bathurst and East Bathurst, N.B., recently began sawing for the season. Recent rains have helped the log drives and reports from all the streams show that timber is moving satisfactorily.

Forest fires that have been raging in Cumberland County have for the most part been checked. The "new forest," consisting of 30,000 Norway pine seedlings, planted by Senator Curry some years ago at Athol, escaped all injury from the ignition that has just swept that section of the country.

The Board of Examiners of Cullers of the Province of Quebec will hold examinations as under:—Hull, July 2nd; Matane, July 30th; Chicoutimi, August 13th; and Quebec, September 2. Intending candidates should communicate with Mr. Elz.-Miville Dechene, Deputy Minister of Lands and Forests, Quebec.

With a capital stock of \$20,000, Laurence & Robitaille, Ltd., Montreal, have been incorporated, to acquire the business of Laurence & Robitaille, for the sum of \$20,000. Power is given to carry on in all branches the business of manufacturing and producing lumber, rough timber, pulpwood and pulp, doors and sashes; and to acquire and operate sawmills.

Tenders are being received for the erection of a sulphite mill and power house at Temiskaming, P.Q., by the Riordon Pulp & Paper Company, 355 Beaver Hall Square, Montreal. Contract will be let shortly. The manager of the manufacturing is C. B. Thorne, Hawkesbury, Ont., whose address will be Temiskaming, P.Q., after June 10th.

News comes from St. Pamphile, L'Islet County, that a young man, Alexander Nicholas, while attempting to ride a log down the Riviere Noire, from a log camp at Seven Islands, Maine, escaped drowning to meet a series of thrilling adventures. Rescued from the water, he lost his way in the bush and wandered for two days. A search party rescued him when he was almost dead from exhaustion and hunger.

A brush fire at Oxford Junction, N.S., caused a loss of \$50,000 to the lumbermen of Nova Scotia. The brush fire escaped from control and ignited a huge lumber pile containing three million feet of miscellaneous timber. The Oxford fire department succeeded in keeping the fire from destroying 1,500,000 feet, working at the scene of the conflagration for twelve hours. The piled lumber is an accumulation of the past two years, and is owned by B. A. Dunfield, of Halifax, and Wilbur Thompson, C. O. Black and Miner McElmon, of Oxford.

Western Canada

The Empire Lumber Company, Limited, has increased its capital stock from \$300,000 to \$500,000.

The Union Box & Shook Mills, Limited, Pembroke, Ont., recently suffered a serious loss by fire. The loss is estimated at about \$150,000, and the insurance at \$80,000.

The shingle mills belonging to Pearson & Company, Burnaby, B.C., Burrard Inlet, were recently destroyed by fire. The owners will rebuild as soon as the loss is adjusted.

Plans are in progress for the erection of a saw and shingle mill at Hope, B.C., by Lings & Roddie, of Rosedale, B.C. The company have purchased a site of 552 acres, on which the mill will be erected.

While working at the rollway at the Elk Lumber Company's camp near Olson, B.C., John Klimuk, engaged in the operation of rolling logs into the river, was crushed to death when the log pile gave way and 15 to 20 logs crushed down.

The Mountain Sawmills, Limited, have been incorporated, with head office at Kamloops, B.C., and capital stock of \$50,000, to carry on business as timber and lumber merchants, and to manufacture and deal in timber and wood of every kind.

The first of a series of shipments of British Columbia fir to the United States was sent from Kingston in large quantities by the Clayton Boat and Shipbuilding Corporation, of Clayton, N.Y., will be used in the manufacture of wooden barges for the emergency fleet of the United States marine service.

Damage to the extent of \$15,000 was caused recently when fire destroyed two dry kilns and about five thousand dollars' worth of the bevel siding in the yards of the Ontario Lumber Company, whose mill is situated on the North Arm of the Fraser River, South Vancouver. The mill was saved with difficulty.

Sealed tenders are being received by the Minister of Lands for British Columbia until June 24, 1918, for the purchase of License X236, to cut 2,481,000 feet of fir, cedar and hemlock on an area adjoining S.T.L. 41359, Lasqueti Island, New Westminster District. Two years will be allowed for the removal of the timber.

Valuable lumber and a considerable portion of the expensive dry kiln of the Acme Timber Mills, Limited, were destroyed by fire which started in the interior of the kiln recently. The plant is located on the north arm of the Fraser River and was formerly known as the Dominion Mills. James Broadford is the manager of the plant, which has recently been cutting considerable spruce for the Imperial Government. The damage done by the fire was about twenty thousand dollars.

For the first time in the history of the lumber industry of British Columbia young women are now employed in the plant of the Port Hammond Lumber Company, Port Hammond, B.C. They are being given a trial in competition with men under exactly similar working conditions. Scarcity of male help has induced the firm to try out female labor, which is being used in clearing away dressed lumber, such as flooring, from the planing machines, tying it in bundles and placing them on live rollers to be handled by male workers at the dry kilns.

The Pearson shingle mills, located close to Burrard Inlet, were completely destroyed by fire recently, only the office and the cook house being left intact. The mill, which was located on the C. P. R. about two miles east of Hastings Station, was formerly operated by Gay and Taylor, and about six months ago was taken over by the Pearson Company, a Seattle concern. The daily output of shingles was about one hundred and fifty thousand. The mill was electrically driven but a small steam plant was kept running for kiln purposes and the burner, a spark from which started the blaze. About sixty men were employed in the mill.

"By-Pass" Blower Systems

for green saw dust and wet stringy material

Material that usually clogs the ordinary Blower is handled easily and continuously by our "By-Pass" Blowers. No material passes through or around the fan. That is the big secret of "By-Pass" success. Slow speed and minimum power are other strong features. Write for literature and all details.

We manufacture and install complete systems

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention!

We have the ONLY device that removes ALL danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, break-downs or dislocation of parts—IT WORKS ALWAYS. Though still new, it is thoroughly tried and tested, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you TEN times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you CAN use them with this equipment; you need it on your cars right now, and you will WANT it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

Standard 2 Drum Engine for skidding or loading. Made in 7 sizes, from 10 to 50 horse-power. One of them is the right size for your work.

Use Machinery in Place of Men

Men will be harder than ever to get this year, and more costly to hire, owing to the conscription regulations. **Hoisting and Haulage Machinery** will not only take the place of men to a large extent, but **will handle your logs at greater speed, and at a lower cost.**

Steam Hoists } For Skidding and Loading
Electric Hoists }
Gasoline Hoists }

Horse or Hand Power Hoists } For Log Loading
Derrick Irons
Traveling Derricks

SMALL FLAT CARS, for any gauge of track, for rapid moving of logs.

Our long experience enables us to give the right machinery, of the right quality, and at the right price.

Have you a copy of our Large Illustrated Catalog? Our Booklet, "Suggestions for the Lumberman," is just off the press. It will pay you to send for a copy if you have not got one yet.

Marsh Engineering Works, Limited Established 1848 **Belleville, Ontario**

When
You
Overhaul
Install

"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Announcement

We are pleased to announce that we are now manufacturing and marketing this exceedingly efficient and useful electric hand barker. It has an almost limitless range of adaptability. It is always ready for quick application to any part to be rossed or trimmed.

Although this Hand Barker was first developed for taking off the small patches of bark sometimes left on wood after passing through a barking drum, it has proved to be exceedingly handy and useful for other purposes as well. We find that it covers a very broad field in the lumber, pulp, paper, and even in construction industries.

As shown above, it is suspended from any convenient point overhead and balanced by a weight. No matter how high or low the work may be, it is a simple matter for the operator to bring the cutting head to whatever position he chooses. The barker is easily handled with one hand. No matter how large the log or how small the pieces of wood, if it is desired to trim off some bark, knots, or high spots, it makes no difference to this handy electric barker.

The shaft connecting the cutter head and motor is mounted in ball bearings. The motor is amply powerful, being capable of developing 3/4 h.p. The length of the barker is about 2 ft. Total weight about 50 lbs.

Any other details you may wish will be furnished on request. Tell us the purpose for which you wish to use one or more of these barkers.

7 EAST 42nd ST., NEW YORK CITY, N. Y.

Ring Oiling

WHY
Bond
Hangers

Eliminate
Hot Bearings

Are you considering the purchase of Hangers for your new factory?

Perhaps you do not realize the necessity of buying hangers that will eliminate hot bearings, or the trouble they will cause in a hanger? If a bearing happened to become hot in a hanger holding six or more machines, and they all stand idle while the shop mechanic fools around trying to fix it, you'd soon realize what inefficiency and expense this is.

The Ring-oiling device on Bond Hangers supplies a constant flow of lubricant on the full surface of the shaft and bearings, which keeps them cool when running at high speed.

Get our catalog containing full details before you buy.

Dunlop "Gibraltar RedSpecial" Belting

Abnormal Friction Pull

vs. Elasticity of Friction

BETWEEN every ply of specially-selected, heavy Cotton Duck in Dunlop "Gibraltar RedSpecial" Belting is a layer of pure Rubber which, through a Dunlop calendering process, so permeates the fabric that it binds the several plies into one integral piece.

Some belt manufacturers offer to sell their product on the basis of "Heavy-Poundage in a Friction-Pull" Test. To obtain the latter result it is not necessary to secure such an expensive Rubber Friction as is used in "Gibraltar RedSpecial." This fact alone ought to be a pretty good gauge of the value of the "friction-pull" test.

In buying "Gibraltar RedSpecial" you get the advantage of years of careful laboratory work on our part with this result: The friction is of that "just-right" elastic quality which allows for the give and take necessary in rounding the pulleys; hence the reason "Gibraltar RedSpecial" is known for maximum Power, Speed and Service.

Note the Short Grain Rubber Friction

This Belt Section illustrates a Heavy "Poundage-Pull" Friction. To secure this result the Friction Grain is short and stiff. Elasticity and Flexibility have been sacrificed to secure such a result.

Note the Long Grain Rubber Friction

Dunlop "GIBALTAR REDSPECIAL" has a Friction of Special Dunlop Rubber that retains its life indefinitely "Note the long grain Rubber Friction," as illustrated. Elasticity has not been sacrificed for Abnormal Friction Pull.

UNLIMITED capacity for service is an intrinsic quality with Dunlop "Gibraltar RedSpecial" Belting. The success of nearly a quarter of a century in the manufacture of Rubber Products is built into Gibraltar. The original Made-in-Canada Red Rubber, Frictioned Surface Belting, "Gibraltar RedSpecial" has stood the infallible test of time in turning the wheels of industry in a multitude of Canadian plants from the Atlantic to the Pacific.

The Dunlop Unreserved Guarantee

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where the "Gibraltar" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

GRATON & KNIGHT

Standardized Series LEATHER BELTING

Tanned by us for belting use

*14-in Graton & Knight Spartan
Leather Belting on difficult quarter-
turn drive. Standard Box Co.,
Baton Rouge, La.*

Here is Economy

"MAKE every ton of coal yield the maximum production." That's the peremptory command of America to manufacturers.

The importance of economical transmission of power cannot be exaggerated.

Economy of transmission is fundamental. It means efficient service. It is the basis of "Standardization" in belting.

Mills that have kept Belt Service records know that the use of Graton & Knight Standardized Series Leather Belts means economy in production. (And to-day they are even more economical, because while they have increased in price, their percentage of increase is **much less** than that of substitutes.)

Talk over the selection of belts with your practical production men, superintendents, and foremen. Ask them these questions: What belts give the longest service? transmit most power? are easiest to repair? have the proper elasticity with firmness best stand mauling of shifters and flanges? when damaged can be cut down for use on narrower pulleys? when worn out bring the best price for scrap?

If you have kept suitable records, you know how to answer these questions. If not, you are only guessing. Start a belt record immediately. Write us for the necessary cards. An accurate record of belting service is as profitable as a record of a workman's service. Tell us the number of drives in your plant and we will mail record cards gratis.

HEAVY
PRESSURE****THE ARISTOCRAT OF BABBITT METALS****SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well. So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours
JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS****THE CANADA METAL COMPANY, Limited****Head Office and Factory TORONTO Fraser Avenue****Branch Factories—****HAMILTON****MONTREAL****WINNIPEG****VANCOUVER**

—economy to-day is a deed of patriotism

—and is extensively engaging the attention of manufacturers everywhere. There are hundreds of lumber mills in Canada with an unproductive scrap-heap. The sawdust and waste wood lying around these mills can be turned into a great asset by installing Wood Distilling and other Chemical Plant. We have specialized in the building of chemical plants; and have installations in all parts of the world—plants with a big guarantee behind them!

DISTILLATION PLANTS: Slabs, Limbs, etc.

ALCOHOL PLANTS: Sawdust, Shavings, etc.

PULP MILL EQUIPMENT: Soda, etc.

OXALIC ACID PLANTS: Sawdust, etc.

WASTE SULPHITE LIQUOR

FERMENTING PLANTS: Alcohol.

Let us hear from you.

Your New Saw Mill

Will give you the best service and the longest service with the least expense for upkeep—If it is a Fisher & Davis Mill.

Catalog of Saw Mills, Edgers, Planers, etc., is yours for the asking. Ask to-day!

FISHER & DAVIS MFG. CO. St. Louis, Mo.

Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

**"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"**

Catalogue is yours for the asking.

ATKINS

ALWAYS AHEAD!

The most advanced improvements in Saw manufacture have placed us far ahead in the manufacture of Saws for all uses.

Our Band and Circular Saws are worthy examples. They cut more timber—do it with less power and require less repair to be kept in perfect condition.

Economy in mill operation has proved their value. Put them through competitive tests with other Saws.

The Sterling quality of

Atkins Sterling Steel Saws

will overcome your difficulties.

Portable Saw Mill

THE No. 5 Portable Saw Mill shown above is adapted to the use of individual or company wanting to work up a small pocket of timber or for use in an out-of-the-way location. It is compact and sturdy and will do splendid work under unfavorable conditions. There are scores of similar outfits in the country today giving satisfaction and making money.

One outfit with Right hand Saw Frame and Carriage—set of track timbers same as illustrated above, shipped immediately to any address.

Sawmill Machinery

The Waterous Circular Resaw

This machine is specially designed for handling rough, knotty slabs or thick lumber indiscriminately. It is very heavy and substantial, and will give satisfactory service under the severest duty.

Besides being able to stand more hard usage than a Band Re-Saw, its first cost is considerably less, as is also the cost of maintenance. When used on slabs, the extra sawdust—in excess of that cut by a band re-saw—coming, as it does, out of the slab or waste portion, is unimportant, and thus the machine is practically as economical as a Band Re-Saw for this purpose.

One of our customers who uses a four-log gang, a circular, and one of these Waterous Re-Saws, states that the latter regularly handles 600 logs, each 16 feet in length, per day of eleven hours, besides all the slabs, which contain at least one board 3 inches wide and 6 feet long each, from 500 other logs. The 600 logs referred to are first sized by the circular into 6-inch squares by running them through to make two thick slabs and two thin ones, and then sent to the re-saw. If the log will not size to 6 inches square, the circular splits it into two thick slabs and sends the two slabs on to the re-saw. The timber that our customer is cutting is hard spruce, and is so hard that he informs us that he is obliged to change saws four times during the daily run of eleven hours.

Waterous

BRANTFORD, ONTARIO, CANADA

"FROST KING" METAL

Our thirty-five years' experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal, made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 35c per lb., Fort William and East; West of Fort William, 40c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 90c per lb.; West of Fort William, \$1.00, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

\$5,000,000.00

**worth of mixed metal
sold annually.**

ST. CATHARINES, ONT. Limited

YESTERDAY labor was the cheapest thing on the market. To-day it is scarce and commands enormous wages. Conserve it.

MANUFACTURERS must conserve their man-power. The problem of the transient can be solved. Make his environment attractive.

CONSERVATION of man power is as important as repairing of machinery. It is not a man's fault if he gets "fed up" with his job. All he needs is a change of mental diet.

AFIFTY-TWO weeks' Y. M. C. A. program will keep your men and boys in line, in tune, invigorated. Look after their leisure hours and the work hours will look after themselves.

The Y. M. C. A. has solved many labor problems

INDUSTRIAL DEPT.

National Council of Y. M. C. A's of Canada

120 Bay Street, TORONTO

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.

Pulpwood, 246,282 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

For maps and full information regarding Ontario, apply to

HON. G. HOWARD FERGUSON,

Minister of Lands, Forests and Mines.

- 1—Waterous double edger for 20-inch saws, lever shifter.
- 1—Payette double edger for 18-in. saws, lever shifter.
- 48—live rolls about 8 ft. long by 10 in. dia.; extra heavy, sprocket drive.
- 20—High cars with roller tops, 24 in. heavy wheels on 3 in. axles, standard gauge.
- 1—Mershon 4 saw gang resaw, takes squared cants or just one face, ideal machine to cut small logs and centres of large after good has been taken off.
- 1—Payette picket machine, made specially for shade roller stock, will feed pieces 16 in. long, also sorting table with chain top.
- 1—Rogers Iron Works circular resaw for making box lumber from slabs; fool-proof machine.
- 1—Payette edger for box and short stock.
- 1—Rogers twin circular or tie maker.
- 1—Payette lath bolter and lath machine.
- 1—Pair lath trimmers.
- 1—Picket trimmer (bunch trim).
- Conveyor drives and chains.
- Pulleys, gears, heavy line shafting and countershafting with bearings.
- Send us your requirements.
- We have a large stock of double and triple leather belting in widths from 10 in. to 46 in.
- 1—Doz. concave carborundum wheels, 12 x 3/4 x 3/8, 365K, for band saw grinding.

Power House Equipment

- 2—Return Tubular Boilers, Polson make, 60 x 16 ft., Dutch oven settings.
- 1—Return Tubular Boiler, Goldie & McCulloch make, 54 x 16 ft.
- Breeching and smoke stack for above boilers, 50 in. dia., newly painted, 600 ft. new 1/2-in. guy and plate for brick pier.
- 1—Northey boiler feed pump, outside packed, 8 in. x 5 in. x 12 in., for 3 in. suction pipe.
- 1—Pair Polson "Brown" type engines, coupled on quarters, 22 in. x 50 in., with 16 ft. x 48 in. belt, balance wheel. Excellent engines.
- 1—Pair American feed water heaters for above engines; 10 in., copper coils.

Filing Equipment

- 1—Waterous band saw grinder for 6 in. saws.
- 1—Baldwin retoucher for band saws.
- 1—Wm. Hamilton band saw shear, 12".
- 2—Reversible saw levelling blocks.
- 2—Chilled band saw anvils.
- Hatchet band saw swages; Crescent circular saw swages; shapers and dressers.

Yard Equipment

- Rails and frogs for yard.
- Booms and boom chains, 1/2, 3/4 & 1.
- Winches and other mill supplies.
- Small shunting locomotive.
- Double carts and waggons.

Prompt shipments and bargains for quick sale. Will send all particulars and prices on application.

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in
choosing the lumber that goes into your products.

No brick gives the best results for every purpose.
The brick you would use for your refuse burner may
not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

**"Elkco Special," "Elk Steel,"
"St. Marys," "Keystone" and "Rotex"**

When sending us your inquiries, specify for what
purpose you need the brick.

We Make a Specialty of

**REFUSE BURNERS, BOILER SET-
TINGS, KILNS, DUTCH OVENS, ETC.**

Catalog sent upon request.

"WE AIM TO SERVE YOU WITH THE BEST"

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Band Saw

"The
Invariable
Choice of The
Man Who Knows"

HOW MUCH DO YOU SALVAGE FROM YOUR KERF PILE?

¶ This is a question to be answered by the individual millman. If he cannot give a favorable answer, then he owes it to himself to investigate. The "341" is a leader in its class due to its superior construction and ability to take an overload and stand up under it. The feature most prominent on the "341" is its Straining Device. This combined with the thin gauge saw used is a sure means of reducing kerf. With this machine you can reduce that kerf pile to a minimum. The "341" shown above is installed in an institution where efficiency must reign. You are welcome to any information we have on the "341." Simply ask for it on a post card. It will be sent free and without any obligation on your part.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 38

Toronto, June 15, 1918

No. 12

Will Lumber Maintain the Prices Which it is Commanding?

Will the price of lumber come down, will present quotations be maintained or will they go still higher? The speculative is always interesting, and everywhere men are canvassing the potentialities of certain trades and industries and their status after the war, preparing for the solution of post-bellum problems and taking stock of the future.

What will occur during the period of readjustment, how will new situations be met, and how long before the abnormal conditions created in the commercial and industrial world will become normal? It is well to look to the dawn of peace, take some thought of the morrow and be prepared to meet contingencies as they arise and to order things, as far as it is humanly possible, that there may be no jolts in business or lapses in production and operation. New avenues of development will open in many lines and greater demands will have to be met. Will all commodities which have gone up in price ever return to their former level; will the scale of living costs be materially reduced; will wages automatically drop or labor become so plentiful that competition in the industrial ranks will alter the excessive demands which are being made today? These and other queries of a like nature naturally loom up in the consideration of present-day propositions, and the question arises, what effect will they have on the production and price of the products of the forest?

Varying opinions are heard. Those who have given some study to present conditions gravely remark that one of these days the bottom will drop out of everything, and when quotations start to decline there will be no such a thing as gradual recession. It will be a quick fall to the bottom and in the upheaval everyone will seek to take any prospective loss quickly. They point to the fact that many members of the trade have done remarkably well in the past by buying up stocks, holding them and taking a chance, with the resultant effect of a nice clean-up. On the other hand, they assert that the confidence

which these optimists had in the future is waning, that there is not the disposition to assume financial responsibility or indulge in speculation as is evidenced in the circumstance that fewer cuts for the season have been sold in Canada up to the present than is usual at this period of the year. Not a few wholesalers, who are regarded as barometers of the market, are holding aloof in the belief and hope that values will recede, and the confidently assert that manufacturers must inevitably be prepared to assume a larger share of the obligations, monetary and otherwise, than they have in the past. This is a brief outline of one side of the story.

The other picture presented is that the figure at which lumber of all kinds sold before the war will never be reverted to, that costs of production are ascending all the while, labor is scarce and inefficient and the outlay for supplies has gone up from seventy-five to one hundred per cent., and more in some cases. The wages of lumberjacks have been doubled since the outbreak of hostilities in Europe, and maintenance has increased enormously. Where are the men for the bush to be secured during the coming season, is a question that is not being very definitely answered, owing to the drain that has been made on the available ranks by reason of the enlistments in forestry and construction battalions; immigration is practically wiped out, and there is no indication that supplies for the logging camp will get back to normal. The amount of timber taken out is steadily decreasing and will so continue. After the war there is a general belief that the export trade will be greater than it ever was, in the palmiest days; that much Canadian lumber will be required for the rebuilding of Continental Europe, devastated by the ravages of the war, and that even with augmented shipping facilities, requisitions will be heavier than Canadian and American mills can ever hope to supply. The timber resources of Great Britain and France have been drained tremendously by the exigencies of the conflict, and home production in these countries will never be able to satisfy the requirements.

Where are the nations in the east to look for their supply except to the American continent, and, as the natural law of supply and demand has always and will ever govern prices, there is no sane ground to support the contention that prices will fall, but that, on the contrary, they will be retained and perhaps strengthened. In the process of readjustment export business will be the great outlet to give stability and permanence to the lumbering industry as a whole in the years that are to come.

Removing the Cause of Friction in all Contracts

Prevention is better than cure. Any system which obviates misunderstandings and bickerings is assuredly one which should be encouraged. Verbal agreements do not count for much when some debatable issue arises or certain matters are taken for granted, which on investigation develop opposite viewpoints. The old method of having everything "down in black and white," as rural people often term written documents, is not such a fantastic one after all. It has protected the rights and privileges of either one party or the other when steps were taken to secure some unjust advantage or turn a sharp corner in regard to a transaction or pending negotiations.

In the lumber business how often have sales been upset by some small and unexpected affair cropping up on which no agreement could be amicably reached. The consignor would contend that such and such was the case, while a diametrically opposite view or claim would be made by the consignee. There are disputes about grading, measurement, deliveries, quantities, demurrage, freight rates, etc. Owing to the frequent changes in tariffs which are taking place on Canadian and American roads, the latter offers a fruitful field for contention and strife.

At a recent meeting of the Wholesale Lumber Dealers' Association in Toronto, the question was brought up of the advisability of the members using in connection with all accepted orders a clause to the effect that the price at which the order is accepted is based upon existing freight rates, and that any additional rates or any extra charges or taxation imposed by the government must be assumed

by the buyer. Here is the clause which one firm inserts as a part of all orders, and also on each slip acknowledging the order and sent to the customer. "These prices are based upon the present existing freight rates, and if the rates are advanced before shipment, the buyer is to pay the increase. Any expense caused by government tax or regulation to be paid by buyer in addition to contract price."

This eliminates all contention, as everything is made clear and explicit on a problem which too frequently has been a source of annoyance and friction.

It may be pointed out that on the sales slips, or more properly speaking, contracts, in addition to the usual blank lines for purchaser's name, the point to be shipped to, the date of shipment and the route, as well as a blank space for F.O.B., there is another blank for the terms from date of invoice, and the following lines are added: "If delivered price is given discount allowed only after freight has been deducted." "This order is taken subject to prior sale and acceptance by head office." There are also lines for the buyer's signature, as well as that of the salesman.

In the form of acknowledgement the name of the customer, the salesman, and the order number are given, and after the particulars are filled in there are the words "Ship to" "When" "Ship Via" "F.O.B." In every case, of course, the clause referred to above in regard to advanced freight rates, government tax or regulation is plainly printed. These simple and legible contract forms and the acknowledgement slips are so definite and distinct that there is little opportunity open for quibble or argument on vexatious points which might otherwise arise.

Are Lumber Dealers Fully Awake to Their Opportunities?

The personal question often comes, "Are we awake to our opportunities?" and as we look about us and take a retrospective view of our life, we find it hard, oftentimes to answer the question. However, the question does us good, for we square our shoulders, and declare we will be awake to our opportunities in the future, if we have not been in the past. The prospective view is bright and we try to live up to it and improve every moment in some way to our advantage, says C. A. Bowen, secretary of the National Retail Lumber Dealers' Association.

And so the same question comes to us, as regards the retail lumber dealers of this country, and we are inclined to answer it in the negative. As we review the progress of the business over several past years, under the direction of the present generation, it seems to us there are so many things they have failed in and so many advantages that they have missed, and so little improvement made commensurate with general upward business tendencies that we feel sure they have not been awake to their opportunities, but have been asleep to their own advancement.

What has been the trouble? Have they been drugged by certain excesses previously indulged in, or have they been careless, indolent and indifferent to the progress around them and to their many timely, convenient and favorable occasions? We do not pretend to know, or to solve the problem, but we believe that the question is coming home to the individual dealers rapidly and that the dealers are all coming to the same conclusion; that they have not been awake, but will be from now on. They are looking to their bookkeeping as never before. They are looking to advertising as never before. They are looking to their overhead and handling costs as never before. They are looking after their customers and giving service as never before. They are learning their own business and telling it to the public as never before. They are thinking more of general appearance of their yards, stocks, offices and display rooms and putting these in attractive shape as never before, and they are watching the markets as never before.

The future **must** be different than the past. They **must** be merchants, from this time forth. They **must** know conditions. They **must** be wide awake. They are squaring their shoulders and we believe they are going to improve every moment and live up to their opportunities.

And then how about the associations. Are we awake? Are we in position to help our members to be alive to their opportunities? Do we overlook opportunities for active service to our members? Let us take a retrospective view and then square our shoulders, take a quick-step and "go over the top," in our important work.

As for our particular association, we are not boasting when we say we have squared our shoulders and have been going forward rapidly and alertly. We realize we have made some mistakes and missed some opportunity, but we are awake for good and if we miss anything from now on, it will be because we have been sandbagged.

Protection of the Woods is Practical Community Business

"Mobilizing the Forests for Peace or War" would have aroused little attention a decade ago. The curiosity of a few might be excited, but others would pass the title up as that of a dreamer. Business men had no time to listen to such academic or theoretical theses, but they do so to-day and with keen delight and active minds. Recently Mr. Robson Black, secretary of the Canadian Forestry Association, spoke to many of the leading exponents of commercial and industrial life in Ottawa. Some facts which he drove home have set new channels of thought moving. Among the cold, hard epigrams presented were that the forest in itself was a poor advertiser, and to-day in Europe, where crop-growing space is at a high premium and heavy populations are crying for elbow-room, a productive forest is valued the more highly as pioneer days recede and industrial and agricultural activities become more highly specialized. After referring to the diletante attitude toward the science of permanent forest production, which characterized practically the whole British Empire for a hundred years past, the secretary of the Canadian Forestry Association said the lesson for Canada was so obvious that during the next few years, unless the country invites a "head-on collision," the forest policies must be taken out of the back kitchen and given a place in public deliberations, not second, even, to that of agriculture. The most remarkable fact in the long history of the Canadian wood-using industries is that lavish attention has been given to the building of modern mills particularly those for pulp and paper, and the perfecting of industrial processes, while, at the same time, absurdly little thought or attention has been devoted to the forest, upon which all investments and processes absolutely depend. The day had gone by in Canada when any man with a dollar invested in a lumber or pulp mill could regard the forest back of his mill as self-perpetuating. The timber possessions of Ontario, and east to the Atlantic, are in a condition of deterioration, which nothing can remedy except rigid fire prevention, more economical logging methods and closer utilization. These reforms will be forced upon Canadians by hard-fisted circumstance.

The forest is the index finger to the future of Canadian foreign trade, but it is a double index finger, and points the eyes of all Canadians to the productive forest, the easiest legacy Canadians will ever lay their hands upon, and, at the same time, the most easily destructible of all national property.

The fact was strongly emphasized that forest conservation was not primarily a lumberman's concern, but community business in the most practical sense. The care and improvement of forests was, in its very nature, a long-time proposition in which no private corporation of necessity could be expected to play the leading part. The state was the responsible trustee for the country's forest possessions, and the measure of alertness exhibited by the state in its forest conservation policies was to be found almost invariably in the attitude of the man-on-the-street toward the natural resources of his country.

J. H. Scott of Bridgeport, Ohio, has described a simple method for quickly computing the selling price of lumber, especially in small lots. For example, if a dealer figures such small lots at \$30.00 a thousand, he can tell the price of any piece of 2-inch stuff by taking one-half of the width and multiplying it by the length; a 2x4-12 will figure 24 cents. Inch stuff is computed by dividing the width by four and multiplying by the length. To get the number of feet divide the price by three.

The Service Wholesaler Lumberman Gives

He is an Important Factor in Manufacture, Distribution and Sale, who Keeps Many Mills out of Difficulties and Gives Customers the Lines They Desire

In the economic problems of manufacture, sale and distribution of which we hear so much to-day, the question now and then arises in the mind of some theorist and reformer, what about the wholesaler? Is he necessary, does he serve a useful purpose, can he not be dispensed with, and how does he justify his existence? For some years there has now and then been a spasmodic effort on the part of certain associations and private individuals to eliminate the wholesaler. He has been charged with pretty nearly all the offences in the trade calendar, and at times has been dubbed a parasite, a hanger-on, a middleman, a fifth wheel to the coach, and a necessary evil generally.

Of course, there are abuses and misfits in every trade, persons masquerading under certain guises who would not reflect credit on any organization or body. There is the scalper, the commission man, the touter, the free lance, and the butter-in, but they are not wholesalers in the best and truest meaning of the word. Any lumberman who has capital invested, and business interests which he has to protect and safeguard, and undertakes in a legitimate way the buying and selling of the products of the forests and the output of two or more mills, is entitled to a place in the scheme of things and is rendering a service which should yield him a return for his labor and a dividend on his investment. He is not an unnecessary factor, but by his business methods, comprehensive knowledge of the trade in its various ramifications and the undertakings which he assumes, should have a just reward.

It has been charged that the wholesaler is growing wealthy, that he is a one-man institution, an individualist, and, therefore, not entitled to as much consideration as the employer of labor or the man who retails the product direct and maintains a yard and distributing facilities for the benefit of the community. It is alleged in other quarters that the wholesaler produces nothing and yet he has been cleaning up the bulk of the profits on lumber operations during the past few years.

Earns all the Rewards that He Gets.

So far as the accusations of wealth are concerned the lumber men in the Dominion, who have scored a fortune in the ranks of the wholesaler can be counted on the fingers of the hands. The charge that the legitimate and responsible wholesaler is a profiteer, purely and simply, is scarcely worth passing comment. The allegation is both malicious and misleading.

It can be said that if it were not for the kindly offices, financial encouragement, expert knowledge and able service rendered by the wholesaler there would not be as wide a distribution, as extended a market, as fluent sales facilities, and as many mills operating and thousands of hands employed as there are at the present time. The little fellow would long ago have ceased to be, the business naturally centralized and merged and competition measurably reduced, with prices prevailing that would not be justified by the trend of circumstances.

The purpose, plan and work of the wholesaler are admirably set forth in a timely article which recently appeared in the "American Lumberman," by L. L. Shertzer, a prominent wholesaler operating in the South. He asks certain pertinent questions and then proceeds to answer them in a logical and virile manner. The queries and the replies follow:

First. Why does a manufacturer want to sell direct to the consumer?

Second. Am I, as a wholesaler, an unnecessary factor in the business, and performing no economic service?

Third. Am I rendering service to the manufacturer?

Fourth. Am I rendering service to the consumer, and do I increase the cost to him?

Where the Grass is Ever Green.

First: I think he wants to sell direct to the consumer for about the same reason the cow, at the risk of an eye and a skinned neck, wants to poke its head through a barbed wire fence to get a nibble of the grass in the other field. "The grass looks greener in the other fellow's field." Mr. Millman has not weighed the conditions, some of which are: The consumer wants to buy delivered f.o.b. his factory. The millman generally wants to sell his mill. The freight problem, constantly increasing in intricacy, is between them. The actual selling, the selection of customers, which is one of the most important

items, is determined more from experience than ability; the additional accounting and the additional credit risk are all to be considered. He has a distorted idea of the profit the wholesaler makes and thinks he makes it easier than he does. But he, the millman, in selling direct to the trade, does not count on dividing with the consumer but on getting all the additional profit himself. I want to show that if he performs the additional service necessary to get it he is entitled to it, but that it will cost him the legitimate wholesaler's profit to obtain it and he will save himself time and work by selling f.o.b. mill to the first-class wholesale trade; and in the last analysis will get more, or at least as much out of his stock.

Second: Am I, as a wholesaler, an unnecessary factor in the business? I decided I must be a factor in the system, else by the very nature of things I would long since have been eliminated. If the legitimate wholesaler has no place, then our whole merchandising process is wrong. Observe I use the term "legitimate" wholesaler. I mean by that that I must have sufficient capital in my business to discount my bills, carry my accounts, and do business right. I must not be confused with the commission man who simply furnishes the order and sends it to the mill to ship and carry the account. He is a salesman and is entitled to a sales commission. In my field as a wholesaler I am a factor in our business credit system and in so far as I carry the accounts and aid in financing I am banker for both the sawmill and the consuming factory.

Marketing Lumber is Scientific Business.

Third. Am I rendering service to the millman? If the manufacturer of lumber prepares his product for the market in a scientific manner, devoting his attention to getting the very best out of his log in grade and scale, considering by-products and the utilization of waste, he will find ample scope for both his ability and capital. He generally finds them both insufficient. In addition to manufacture, the marketing of lumber is in itself a scientific and far-reaching business. The manufacturer can not perfect a sales organization that reaches the consumer without an expense equal to, or greater than, the operating expenses of the wholesaler. This additional investment and organization should earn additional profit, which the millman is entitled to because of additional service.

I decided that whether or not I can be of service to the millman depends upon his experience, organization, financial strength and point of view. If he is one of the big boys with an expert accounting department, traffic manager, an experienced sales manager and credit man, and a salesman on the road for each car per day he manufactures, with ample capital to carry it all, I can not help him any because he has already added to his manufacturing organization a selling service equal to mine. It then becomes a question of experience and ability, of salesmanship and service, as to who gets the business.

I think it costs him more to sell a car than it does me because he sells his own stock only, which is more or less limited. By the time he figures his selling expense, extra credit risk, and the infinite number of things that enter into getting to the man who cuts up the stock, especially if he counts the worry of it, he has earned all he gets, just as the wholesaler does. He has not earned more than a reasonable wholesaler would make in handling his stock.

Handling Stock on 10 Per Cent. Mill Cost.

It costs an average of 8 per cent. of the f.o.b. mill price to sell lumber through salesmen to the consuming trade; so the manufacturer who goes after the consuming trade is up against an additional cost of 8 per cent. Almost any reasonable wholesaler will handle his stock for not exceeding 10 per cent. of the f.o.b. mill cost—discount the invoices, assume the credit risk, and loan the railroad, without interest, the \$3,000 or \$4,000 any large business has to carry in freight claims.

I can render service to that large number of moderate sized and all the small producers whose output does not justify a selling organization, and who want mill inspection and settlement. I can render a larger service to many deserving firms who need capital to carry their stock. If it were not for me they could not run. I am to them a bank—a lumberman's bank, understanding their business and needs, in many instances, better than they do themselves. Some of the larger manufacturers say it would be better if they did not run. But this is a moot question. I have heard some of the smaller ones say that after a big one gets over \$1,000,000 he should be made to stop and give some

of the little fellows a chance, for what can a man do with over \$1,000,000, except to satisfy money lust? So there you are.

Except in cases mentioned, therefore, I think it pays the producer to sell to the responsible and reasonable wholesaler. He will handle the stock and take chances on a profit at a margin no greater than what it will cost the millman to get the business direct, by the time he takes into account all the conditions. If the mill wants to sell f.o.b. and the consumer buys delivered, then the wholesaler fills this need, and in proportion to his investment and sales service is entitled to profit.

It must be remembered I am defending the position, if it needs defence, of the reasonable and responsible wholesaler. I have no patience with the boys who expect the mill to deliver the stock and they pay for it after the customer pays them; nor the class that consider the manufacturers simply a field to be exploited. They think they should have an average of \$5 a thousand and be guaranteed that they get it. They are parasites—the kind that get the millman and wholesaler at odds. The purpose of this article is to bring about a better understanding between the mills and that class of wholesalers who are satisfied with a reasonable margin and who expect to render service in proportion to their profit.

If my promise is right and I can show the millman that it is, I can render him service. If I can not show it to him it is either the fault of my logic or the density of his reasoning machinery. To convince him of it is sometimes difficult, because he does not keep analytical records, and can not appreciate my ability to secure him as much f.o.b. in the final analysis as he could get, and yet at the same time make a reasonable living for myself. To be of service to him, however, I must show him that I am not trying to make it all on one car, nor to get rich by his account alone. If he has an exaggerated idea of my profits as a wholesaler, I should be willing to throw my cards on the table occasionally, and I will leave a standing proposition with him that I will handle his lumber for 10 per cent. I must show him that our interests are mutual; that if I take him on as one of my shippers I protect his interests and pay the limit I can afford; and I will go fifty-fifty with him all the time, standing by him in a depression and he to stand by me in a boom.

I must show him that I will place his product in its logical territory and to the right class of trade. Unless he is an old hand at the game, he might not know there are consumers and consumers. He might pick out his consuming trade in Evansville or St. Louis when his stock would move much more advantageously to the south or east. He might be selling interior, with an exceptional export product. He might ship a car of his South Carolina, Alabama or Louisiana oak, or possibly a car of poplar, with a little sprinkle of magnolia in it, to one of those boys up in Philadelphia or New York who are still finicky about getting "soft" stock and he has overlooked the word "soft" in their order, or, having noticed it, thought it was unimportant! They would soon show him how appreciative they are of dealing direct with him! Or he might sell a car of tupelo and ship about half black gum, thinking that they did not know the difference and it would pass. What would he do when he received one of those classic "collect" messages some of our consuming and yard friends have been known to send (and I fear all of them have not yet been sent), something like the following: "Car shipped as tupelo over 50 per cent black gum. Can not use. Wire disposition." Would he call on me to help him out? Possibly so. I would not tell him that I had a rule not to handle rejected cars, but would wire the agent to reassign the car (embargoes permitting!) to a firm I knew did not object to black gum, and everything would be lovely.

Keeping Things Running Smooth With Mill.

Now I take it I should not call myself a high class and responsible wholesaler unless I could avoid all this, keeping my mill connections out of hot water and giving my customer the class of stock he desired. By "responsible wholesaler" I mean one versed in the art of scientific distribution; and there is no question but what that kind can render the millman service. If I quit my wholesale business and handle only my own lumber, I would sell the wholesaler and use the time I saved by getting a better grade out of my logs in the scientific utilization of waste, and in making myself the best sawmill man in the community. I might keep one or two pet consuming customers, but no wholesaler begrudges his millmen that.

Fourth: Am I rendering service to the consumer, and do I increase the cost to him? It is a well-known fact that the large mills with their own selling organizations going after the consuming trade are the highest priced firms in the market. This is due to the fact that their selling cost is greater in proportion than that of the wholesaler, the account being restricted to their own production. They have not the same spread to absorb the selling cost. And again, if they find their prices are such that the wholesaler can come in and squeeze out a little margin, they generally boost them to where he can not.

I figured on supplying a factory with its requirements for a year. The buyer, thinking only of my position as a wholesaler, stated he

thought he could save by placing his contract direct with the mill. I told him I would take it on a competitive basis, provided he figured with a mill that could or would undertake the whole contract as I was doing. I gave him the names of five large mills to consult direct, besides those he had. I secured the contract at the average prices quoted by these mills. In so doing, did I not save my customer further buying expense for the year, and assure him of his supply at an average price? And did I not secure for my mill connections the top of the market less the selling cost along the lines I have outlined?

Wholesaler Does Not Boost the Price.

My observation may be biased by my position, but I lay down the proposition that the wholesaler does not boost the price, and if anybody works on a cost-plus basis it is he. The plus is much less in proportion to his investment, service and risk than that of almost any other business. He is more frequently caught short supplying a contract to his factory than he is finding himself long on his sawmill purchases on an advancing market. As a general proposition he has the highest percentage of any department of business in standing by his ethics in filling his contracts on both ends of his business, because his assets are satisfied customers and mill connections.

If I can show my customer that as a wholesaler I do not increase the price to him, but rather insure him his supply at an average price; that by taking his business in large blocks I decrease his buying expense and enable him to figure a year ahead on his cost; that, whether I do it from policy or necessity, my business life depends upon giving him a square deal, am I not rendering him a service? I render him a further service by giving him the class of stock he needs on the most advantageous rate. For on the proposition that I put the millman's stock where it is most acceptable, I must perforce give the customer stock that is most desirable.

I have decided I can be of service to both these boys if they permit.

Railway Freight Increases Adjusted

Mr. A. E. Clark, chairman of the Wholesale Lumber Dealers' Association, Incorporated, and Mr. Gordon C. Edwards, representing the Canadian Lumbermen's Association, called upon Sir Henry Drayton, chairman of the Railway Commissioners for Canada, recently, and discussed further with him the situation in connection with the increased freight rate on shipments from Canada to the United States. After seeing Sir Henry Drayton they proceeded to Montreal and interviewed representatives of the Canadian Pacific Railway and the Grand Trunk Railway. The result of their endeavors is that the railway companies have agreed that the freight rates on shipments of lumber to United States points shall be the same, so far as the United States' end of the haul is concerned, as shipments from United States points into Canada.

The 25 per cent. increase upon United States freight rates which is to become effective on June 25 will, therefore, prevail in connection with the United States end of shipments from Canada. Had it not been for the efforts of the lumbermen in this connection it is more than probable that the 25 per cent. increase would have been added on top of the 15 per cent. increase which the Canadian railways had put into effect both on domestic and on United States traffic. According to the new arrangement the increase will be only upon the old rate plus the 15 per cent. increase with its maximum of one cent per hundred pounds.

It is learned unofficially, but quite authoritatively, that the Board of Railway Commissioners for Canada will put an order into effect along the lines reported above. This order, however, cannot become effective until thirty days after it has been issued. In the meantime, to offset the advantage which the railway companies took of the lumbermen recently by extending their 15 cent. increase to United States traffic, the 15 per cent. increase will prevail instead of the 25 per cent. increase permitted by the latest United States order. Thus, while Canadian shippers will be paying under the 15 per cent. tariff, they will escape the 25 per cent. increase until thirty days after an order has been issued by the Canadian Board.

When the new international order issued by the Board of Railway Commissioners for Canada becomes effective it will follow the lines of the United States order permitting an increase of 25 per cent. with a maximum of five cents per hundred pounds.

Burning Green Wood in Logging

It has fallen to the lot of a Canadian inventor to solve the problem of burning wood in logging operations, both in yards and locomotives, and make it impossible to cause forest fires from this source. It is a portable machine (not a spark arrester). The nose of the machine is introduced into the fire door opening of existing steam boilers, and operations start at once. Six stationary plants are already built in British Columbia carrying out the same principle—burning green wood.

Why Open Book Accounts Should be Abolished

They Represent Credit Which is Tied Up While Adoption of the Trade Acceptance Method Enables Capital Covered by Account to be Kept Working

The use of the trade acceptance is meeting with increasing favor and its advantages are so obvious and its application so simple and effective that it would seem as if little new material could be presented on the question.

Education, however, is a slow process with some. The Missouri spirit of "show me," while commendable in many respects is occasionally a barrier to progress and enlightened mercantile and industrial methods. There are always a few who, even after they are "shown," still adhere to the former order of things. They are loath to undertake or adopt any new system, clinging to the time-worn tradition that what has answered in the past is still good enough, particularly during the present period, when conditions, commercial and financial, are so abnormal. The war has, however, upset many cherished associations and turned topsy-turvy practices which have been ingrained for generations. The bulk of the business of the world will still continue to be done on credit or paper, but there is a vast difference in the kinds of credit that may be used or extended and in the classification of the obligations assumed.

Ushering in Better Order of Things

Shorter methods, more negotiable instruments, more elastic and more complete relations have been rendered necessary by the operation and expansion of business and the efficient administration of commercial affairs. One of the things destined to go by the board is the open book account. It has served its day and generation and can no longer be defended on the plea of convenience, economy, necessity or safety.

In the last issue of the "Canada Lumberman" considerable space was devoted to the explanation of the trade acceptance, and its numerous benefits to buyer and seller set forth. Many lumber organizations in the United States are adopting the trade acceptance, which has been received with enthusiasm. The Wholesale Lumber Dealers' Association of Toronto, has also looked with favor upon the plan and a number of reputable and progressive firms have incorporated it in their business and made it part and parcel of all their transactions with customers. It is now certain that as a result of this body taking the question up, the trade acceptance will become in the near future fairly general in its use in the east. It is desired that the retailers should follow the good example set by employing the trade acceptance for even small accounts and by insisting upon its use or the payment of interest upon open book accounts.

Paving the Way by Educative Means

Much literature has been issued by the American Trade Acceptance Council, embracing committees of the Chamber of Commerce of the United States, the American Bankers' Association and the National Association of Credit Men. Many banks and others have supplemented this publicity by brochures of one kind and another to direct public thought upon questions relating to national prosperity. It is pointed out that there still exists a surprising lack of knowledge regarding the trade acceptance system and in the belief that the substitution of trade acceptance for open book accounts will be of vast and immediate benefit to all business interests and materially develop the credit resources of the country, the work of instruction and education goes on encouragingly.

One of the most convincing and forceful booklets on trade acceptances out of the many which have come into the hands of the "Canada Lumberman" is that prepared by R. H. Treman, deputy governor of the Federal Reserve Bank of New York. He ably points out that those who settle by trade acceptance put themselves into a class of preferred buyers the same as those who discount for cash as against those who, declining to use trade acceptances, insist upon a long open book account. Mr. Treman then emphasizes that the trade acceptance is a check against overbuying, which is most desirable in these days of high prices and slow moving stocks, by reason of limited building operations. He adds that giving trade acceptances strengthens business standing and that, among the national business vices, are those of trying to do business on inadequate credit and giving too long credit. Trade acceptances are what bankers call two name paper, i.e., drawer and acceptor, and as such are considered more desirable paper for bank investment than single name paper, i.e., promissory note with no endorser.

Continuing, the writer ably sums up matters by saying: Book accounts may be of high grade and absolutely good but they are not

readily convertible into cash. The sale and distribution of merchandise is a most important part of our business system and the accounts created thereby should be liquid and not tied up. To reduce costs, to inaugurate economies, to make more efficient business methods are for the public good,—and the retailer, by giving trade acceptances, relieves the seller, that is, the manufacturer or jobber, from the burden of acting as his banker, a service which the seller has been practically forced into rendering and at considerable expense for the necessary capital.

What Long Extended Credits Mean

The retailer, finding it easy to secure long time credit, not realizing that he is paying dearly in prices of goods for this credit, falls easily into the habit of extending unreasonable lines of credit to his own customers, thus in turn training them to have not definite time for payment. **These long extended credits mean slow collections, bad debts and great economic wastes.** This practice puts a burden on the retailer of limited capital whereas by using the trade acceptance with those from whom he buys the retailer can also inaugurate the same system with his own customers especially on sales of fairly large amounts, thus putting his own accounts into paper which can be readily sold to his banker. The use of the trade acceptance will

(CITY OF DRAWER)		(DATE)	191	No.

A regular form of trade acceptance.

make better merchants, more conservative and less dangerous to competitors who derive a limited reasonable profit from their sales.

The retailer will have a stronger sense of responsibility towards his obligations if he agrees to definite periods of payment and knowing the exact dates the trade acceptance becomes due, he can arrange to meet these obligations.

The buyer should not hesitate to give a trade acceptance in payment of an honest debt as he assists the seller the same as if he pays cash and he can feel that in this way he is "doing his bit" in making the nation's credit position sounder.

The use of the trade acceptance establishes quickly the correctness of the account as between buyer and seller, obviates the tendency to friction over differences, not reported until the account is due, reduces the expense of collection and lessens the cost of conducting business. To carry on the open book account system, sellers strain their own credit in order to extend credit to the buyer for an indefinite time, frequently without interest, security or even any evidence of the sale, a custom which often results in loss by non-payment of the account.

The buyer should be willing to give the seller a trade acceptance which is a negotiable acknowledgment of the debt no less readily and with no more hesitation than he would give his banker a promissory note for money loaned to him by the bank.

Will Improve Status of Small Man

The use of the trade acceptance will put the smaller retailer, especially those with limited capital, in a better position to compete with those who have larger capital. The trade acceptance is scientific and will work a great improvement on our whole merchandising system and tend to make the untrained and unsystematic tradesman of less menace to his competitor who does business on sound methods.

Many a retailer who has difficulty in securing sufficient capital depends upon competing jobbers to extend him long credits for which

he pays by higher prices, whereas by making a few changes in his business methods, using the trade acceptance with his own trade, his cash resources can be materially improved and in many cases the trade acceptance given to him by his own customers could be turned over to the jobber or manufacturer from whom he buys.

There is no more difficulty in using the trade acceptance than in using the so-called farmers' notes or lien notes. Business would be much bettered if the methods of taking notes for long periods were abolished and the trade acceptance substituted also by turning over to

the banker the loans which many of the merchants have themselves been making to their customers.

Under the open book account the conditions as to credit are undefined and uncertain, whereas by the use of the trade acceptance credits would be defined and certain, and thus there is provided the most approved and economic method of transacting business.

The use of the trade acceptance will tend to simplify bookkeeping and will obviate the need of long book accounts and borrowing to enable the retailer to extend long credits to his customers.

Compensation Board Will Apply Merit Rating *Employers with Bad Accident Experience will be Required Under New System to* *Pay More Than the Preferred Rates—Rates Finally Fixed for 1918*

It is scarcely correct to say that the rate on sawmills has been raised from \$1.10 in 1917 to \$1.50 in 1918, or that logging operations have been raised from 90 cents to \$1.20, writes the Chairman of the Workmen's Compensation Act for Ontario, to the "Canada Lumberman."

The \$1.10 on sawmills and the 90 cents on logging operations for 1917 are preferred rates, the \$1.50 and \$1.20 for 1918 are provisional rates. Employers with a bad accident experience will be required, under the system of merit rating, to pay more than the \$1.10 and 90 cents (the precise manner of applying the merit rating has not yet been determined).

At the end of the present year the 1918 rate will again be considered, and if the circumstances justify it will be reduced as the rates originally fixed for 1917 were reduced. The sawmill rate originally fixed for 1917 was \$1.80 and for logging \$1.80. The 1917 preferred rates are abnormally low even in comparison with the very low rates generally prevailing in Ontario as compared with those in other places. One reason for this is that the balance carried over from 1916 was much larger than anticipated, by reason of the fact that the employers' actual payrolls for 1916 exceeded their estimates to a much greater extent than was expected.

It is to be expected, however, that the rate finally fixed for 1918 will exceed the rates charged for 1917. One reason for this, as above mentioned, was the unexpectedly large surplus from the year 1916. Another reason is that for 1918 there is a full year's medical aid to be provided for as against only half a year's medical aid in 1917. The Board also prefers to fix the provisional at what appears to be a reasonably safe figure and reduce it at the end of the year if the experience justifies.

In the table of rates book for 1918, which will be mailed to any employer requesting it, there is an explanation of the difference between the 1917 and 1918 rates. It is as follows:—

The figures for 1917 show an exceedingly satisfactory condition from the employers' point of view. Very extensive retroactive reduction of the 1917 rates, as fixed at the beginning of the year, is being made in most of the important classes of industry. This is partly by reason of the experience for 1917 being good, partly by reason of there being a balance from the prior years, and partly by reason of the adoption of merit rating, the reduced rate being in reality a preferred rate. Employers with a bad accident experience will later, as soon as their accident experience for the year has been finally ascertained, be required to pay an additional percentage.

The rates provisionally fixed for 1918 are in general higher than the 1917 preferred rates. Some addition was necessary because a full year's Medical Aid is to be provided for in 1918 while only a half year's Medical Aid had to be provided in 1917. Other differences are explained by what is stated in the preceding paragraph. If found to be more than sufficient, the 1918 rates will be retroactively reduced at the end of the year, as has been done in the case of the 1917 rates.

The Method of Rating Explained

For assessment and compensation purposes under the Act the industries covered are divided into 34 classes or groups. Each class stands upon its own footing and carries its own burden, except that a very small general fund, one per cent. per year, known as the Disaster Reserve, is set aside to assist in meeting any extraordinary call that may arise in any class.

Separate accounts are kept of all assessments received and all compensation awarded for each of these classes. Each

of the 34 classes of industry is thus in effect a mutual insurance association of the employers in that class.

The rates for each class are fixed and the assessments made much in the same way as a municipality devies its taxes. They are governed by the requirements. The rates fixed for the year are intended to cover the burden for that year. At the beginning of the year an estimate of his probable payroll is obtained from each employer and he is assessed provisionally upon that estimate. At the end of the year the actual amount of payroll is obtained and the assessment is adjusted accordingly.

In fixing the rate the experience for previous years is used as a guide. The amount of compensation and the amount of assessments in the class for the preceding year are ascertained, an estimate being made of the amount still remaining to be paid for accidents which by reason of continuing disability or for lack of reports have not been finally disposed of before the end of the year, and compensation being also made of the extent to which the actual payroll statements received from employers at the end of the year will exceed the estimates given by them at the beginning of the year. In this way the total expenditure and the total income of the class for the year are arrived at as nearly as possible, and the sufficiency of the rate charged determined.

If it is seen that the rate charged has produced sufficient money, or if the surplus or deficit is small, the same rate will be continued for the current year. If there is any considerable difference, the rate will be increased or decreased accordingly; and if the difference is large, the rate will also be altered retroactively for the prior year.

It is to be remembered always that any surplus to the credit of the class remains in the class funds, and this is also taken into consideration in fixing the rate.

Where there are different lines of industry in the same class, each bearing a separate rate, the experience in each separate line of industry is also considered, and if the situation calls for it the proportionate ratings as between the different lines of industry in the class are altered. As, however, each class in the schedule is an insurance group, all lines of industry in the class must share to some extent the good or ill fortune of the class as a whole, and the rating for each separate line of industry cannot be made to depend upon the experience in that line of industry alone; the experience of the class as a whole must be considered. This is especially the case where the amount of payroll in any line of industry is small. To charge that line of industry with its own cost might place a very excessive burden upon its employers for one year, while perhaps relieving them almost wholly from assessment another year. This would destroy the underlying principle of insurance which is the basis of the system.

The way to keep the rate low is to avoid accidents. This will now be a matter of special individual concern to each employer, inasmuch as under the system of merit rating which is being adopted the employer who has a bad accident experience will pay a higher rate of assessment than the employer whose accident experience is good.

The report of the Board for 1917 is expected soon from the printer. This gives the class figures and other information for 1917 and also 1916, and the Board will be glad to mail a copy to anyone desiring it.

Taking Lumber Orders by Means of Motor Car

It Enables the Salesman to Cover the Ground Quickly and Thoroughly—More Calls are Made and Larger Number of Towns Visited

By "Speed Limit"

Selling the products of the forest by automobile would a decade ago have been regarded as an innovation of the freak type, but time brings in its wake numerous changes. While motor trucks have been used for the delivery of lumber and building material for a number of years, it is only of comparatively recent date that salesmen for lumber have made their rounds in a "jitney." There may be nothing very new in a traveller having taken an occasional trip out over his territory in a motor car, but to use this conveyance day in and day out for several months in the year for business purposes is a record which few other lines can surpass. The automobile is taking its place among the activities of ordinary life, not only in a social sense, but as a means of daily communication.

It was some three years ago that I conceived the idea of covering Western Ontario with a small car. Gasoline was then only fifteen cents a gallon and one could get about for less than a cent a mile. Today the fuel for my machine costs me 35 cents a gallon, and the mileage in some instances is not quite as great as in the earlier days, the expenditure for gasoline averaging around a cent and a half a mile. But even then there is an infinite source of satisfaction in moving from town to town in a motor car, calling upon retail lumber dealers, and taking carload orders.

What are the advantages of such a method? In the first place there are no trains to wait for. Owing to the lessening of such facilities by the railroads many valuable hours are lost by a salesman having to hang around a town, where after completing his calls there is nothing to do. He cannot get out until very late at night or early the next morning and if a train goes too early in the day he has to hurry unduly through his business. His work is thus not characterized by that thoroughness and concentration which it is when he has nothing to worry about in the way of moving on to the next place. When his calls are completed the salesman is ready to start and his means is right at hand.

Another obvious advantage is that many of the smaller places can be visited, centres where even the railways, steam or electric do not run. When passing along by means of motor car every burg which has a lumber dealer is paid a visit. I think my record was in getting to eight towns with my car and calling upon thirteen customers in one day. Usually I cover about 300 miles a week and visit probably an average of twenty-five to forty centres. Of course, an automobile can only be employed where population is rather compact and the roads, at least, passable. Possibly not all the provinces are suitable for selling lumber by this means as the distances to be covered are too great, the towns being too far apart.

Making the Calls Without Loss of Time.

Not only is a great deal of time gained by being able to leave when one is ready, but frequently on going to a city or town, one finds that Mr. J— is out of his office and will not be back for an hour. It is easy to proceed to see Mr. K—, and if he is not in, one can slip over to Mr. L's place of business. The traveller generally manages to catch one of the three in, and by the time he has sold him a carload or two, he can make his way back to the others in his runabout without loss of time and thus business is closed up much more quickly than it otherwise would be.

A number of retail lumbermen also do contracting and when one calls he finds the man is some distance away, overseeing a job. To walk that far causes the loss of a lot of time and yet to neglect seeing the dealer would be shortsighted. With a car one can get into immediate touch with the contracting dealer no matter where he happens to be working. Another instance where a roadster comes in decidedly handy is that a yard man will say "Yes, I need so many thousand feet of such stock, but I will have to see the foreman on the job first; I will let you know by mail." If one has a buzz waggon he can say, "jump right in here now and we will go over and interview the foreman at once and close up this little matter." Nine times out of ten the retailer will readily comply and thus many an extra order is booked which would possibly never be secured. If one goes to an office and finds that Mr. T— is out and will not be back for a couple of hours and there is only one other buyer in the town, and he, at the other end, the roadman is in a dilemma unless he has a car. He does not know whether to wait or to move on. With a motor at his disposal he covers the ground quickly, sees the other fellow and returns in time to catch the first man.

To sum up, the main advantages that I see in travelling the coun-

try with a flivver is that there is no loss of precious moments, and many more towns can be reached than by rail. The expense of this method of selling, even when the wear and depreciation of a car is taken into consideration, is less than by rail, while the territory that one gets over is much wider and work can be more thoroughly and expeditiously done. The roads are in a fair condition, generally speaking, and after the calls of the day are over, another centre can be reached in the evening owing to the longer hours of daylight afforded by the daylight saving plan which went into effect recently.

There is only one regret that the salesman has, and that is when he is convicted and fined for speeding—as he frequently is if he gives full vent to his desire to get over the turf quickly when he strikes a smooth piece of thoroughfare—he cannot charge up the assessment to his travelling expenses, but has to meet the levy out of his personal means. The exaction is generally too heavy to be smuggled under any separate item in an expense sheet or added to a sale's order in these days of ascending prices. The ideal condition from the salesman's standpoint will be reached when the firm pays his fine every time that he scorches. Of course, he is violating the traffic regulations in the interest of his company and not for the mere thrill and excitement of a swift dash. It is simply his desire to get there and land big business that prompts him, at times, to throw discretion to the winds, take a chance—and incidentally, with county constables everywhere alert—a conviction.

Renfrew Firm Won in Lumber Suit

Judgment was given by Mr. Justice Sutherland at Osgoode Hall, Toronto, recently, in the action against John H. Eyer, of Toronto, brought by Ferguson and McFadden, lumber dealers, of Renfrew, to recover \$61,998.87, and interest on a cheque for lumber alleged to be purchased by the defendant. The lumber was burned by a fire in the plaintiff's yards and insurance on the loss was paid by the insurance company to the plaintiff, no transference of the policy having been made to the defendant. In delivering judgment, Mr. Justice Sutherland said: I am of opinion that the agreement of the 14th of June, 1910, was the contract entered into between the parties under which their rights are to be determined, and I am also of the opinion that the property in the lumber in payment whereof a cheque was sent by the defendant had at the time of the fire passed to him and thereafter the lumber was at his risk as to loss by fire. The sending of the cheque when it was known by defendant that the lumber was not f.o.b. cars Tomiko indicates that such was defendant's own understanding. With some hesitation I have come to the conclusion that plaintiffs have shown that there was no want of such reasonable care on their part of the lumber in question as a prudent man would exercise with reference to his own property and that they have negatived the charge of negligence preferred against them by defendant. The plaintiffs will therefore have judgment for the amount of the cheque sued on, namely, \$61,998.97, with appropriate interest and costs, and the counter-claim will as to both them and the company defendants by way of counter-claim be dismissed with costs.

Will Investigate the Housing Problem

A sub-committee of the Resources Committee has been appointed by the Ontario Government to investigate the housing conditions in the province, Sir John Willison is the Chairman, and among the other members are Rev. Peter Bryce, Capt. S. H. Marini, H. H. Williams, H. V. S. Jones, J. H. McKnight, G. Frank Beer, Ald. J. Gibbons, Thomas Roden, M. J. Haney, H. C. Scholfield, and E. J. S. Duncan, all of Toronto. In a recent announcement regarding the appointment, Sir William Hearst, Premier of Ontario, said: "The subject is essentially a municipal one, and some municipalities have already active committees dealing with the question. Therefore, for the present, no representatives from outside cities and towns have been appointed on the committee. It is expected that the committee will get in touch with municipal councils and other organizations interested in the subject throughout the province, and that they will give to these bodies all information and assistance in their power, and should it be felt wise later on that representatives from municipal councils or other organizations in the province could be added with advantage to the work of the committee, this will be done."

How Retail Association Got "Over the Top"

The Southwestern Ontario Organization is Doing an Important Work and has Aroused much Enthusiasm and Harmony Among its Members

One of the aggressive organizations of retail lumbermen is that of the men engaged in the industry in the Southwestern part of Ontario. The Association is known as the Southwestern Ontario Lumber Dealers' Association and was formed in the spring of 1914. The principal promoters were Chas. Hubbell, of Thamesville, past president of the association, B. F. Clarke, Glencoe, the present energetic secretary and his partner, Allan McPherson.

The object at the time was to promote a better feeling among the dealers in their own locality and to become better acquainted with one another. The organization had a modest beginning and the men who took such active steps in its formation had no idea of anything at the time beyond forming a little local body. They found, however, that each new member who joined wanted to get his nearest neighbor into the companionship and co-operation of the small band and thus the boundaries widened and the membership became greater. The association later fixed its territory so that it took in the southwestern peninsula from London to Windsor, including both of these cities. The aim of the association has always been to hold at least one meeting every three months, and since the Ontario Retail Lumber Dealers' Association was formed the territory of the Southwestern Ontario Retail Lumber Dealers has been extended farther east, taking in the districts around Aylmer, St. Mary's, etc.

The officers are:—

President—W. J. Taylor, Ridgetown.

Vice-President—W. A. Hadley, Chatham.

Secretary-Treasurer—B. F. Clarke, Glencoe.

Executive—D. J. McEachren, Alvinston; A. W. Osborne, Sandwich; John McGibbon, Sarnia; William Saunders, Dutton; C. M. Smith, Aylmer, and Geo. H. Belton, London.

The annual membership fee is five dollars. The first president of the association was F. H. Laird, of Dresden, and the second, Chas. Hubbell, of Thamesville, who retired at the recent annual meeting, being succeeded by W. J. Taylor, of Ridgetown.

Until last year all the meetings of the Association were held at the Hotel Sanita, Chatham, but in 1917 the Windsor dealers invited the gathering to that city, and this year the convention was held in Sarnia at the special solicitation of the retail trade there. The Association endeavors to make the annual session the big event of the year.

The Purpose and Plan Outlined

The official bulletin of the Association sets forth why every retail dealer should become a member. In the introductory pages of a neat little booklet the following inspiring and forceful talk appears.

Because this Association directly benefits every retail lumber dealer in Ontario all should support it and share the labor and expense. Note some of the important benefits derived from this Association:

1. Mutual information concerning unfair trade by wholesale dealers, manufacturers and mail order houses who violate all rules of fair trade.

2. Exchange of information and ideas for mutual benefit, to the end that each member may have at hand such knowledge of conditions as will best enable him to improve his business methods and to meet unfair trade according to his best judgment.

3. The interchange of ideas—

Why not avoid an expensive mistake by hearing of someone else's experience?

Why employ antiquated, costly methods, when someone can tell you a simple, cheap, up-to-date improvement?

4. The Mechanics' Lien Law.

The best safeguard known against financial unscrupulousness, a sure collector for a just debt when rightly used. A moral incentive to pay, among delinquents.

5. Legal Order Blanks.

Furnished free to members. Helpful in avoiding errors. A legal contract in case of dispute. A simple method of arbitration and a protection against the unscrupulousness of either party thereto.

6. The Social Side.

The getting together of those in your line of business. The spirit of brotherhood which engenders friendly rivalry instead of brutal antagonism, and which, through its understanding sympathy, smooths so many of the otherwise rough spots in business.

Now read these over again. Think about them. Thoroughly

digest them. The briefest possible outline is given above. Enlarge upon it. Consider the unlimited possibilities for the improvement of our business by the strengthening and upbuilding of this Association. Join us and work with us.

The constitution also sets forth in succinct form what the organization stands for, the rights it recognizes and the benefits it affords, and says in part:

"We realize the convenience, if not the necessity, of the retail lumber dealer to every community, and are interested in the promotion of the general welfare and perpetuation of the retail lumber business.

"We recognize the absolute right of every person, partnership or corporation to establish and maintain as many retail yards as they or any of them see fit.

"We recognize the right of the manufacturer and wholesale dealer in lumber products to sell in whatever market, to whatever purchaser, and at whatever price they may see fit, but we believe that sales by wholesalers and manufacturers to consumers has a direct tendency to destroy the retail trade. This fact is so well recognized and regarded as contrary to trade ethics that such sales are, for the most part, made in secret or under cover, and, therefore, we should be better informed of the nature and extent of such sales than we can be by individual effort.

"We also recognize the mutual advantage to be derived through association and exchange of ideas in matters concerning our business, such as standardization of grade and size, and other things which would also be of great benefit to the public.

Shipbuilding Active in Nova Scotia

Timber Which Has Not Had an Axe in it for Thirty Years is Now Being Worked to Advantage

Wooden shipbuilding, which has had such a wonderful revival since the war began, is not yet showing any signs of declining. On the contrary, it appears to be developing faster than ever before, and will probably reach even greater expansion. Vessels are being constructed where none has been built for at least twenty years, and the number turned off will only be limited by the scarcity of workmen. It is safe to say that there are fifty per cent more vessels on the stocks now in Nova Scotia than there were at the beginning of the year, while in the meantime a number of fishing craft and some schooners of larger size have been launched. The activity in the shipyards naturally makes a marked change elsewhere. Many men are now employed in getting out and transporting ship-timber, and timber land that has not had an axe in it for thirty years is now being actively worked.

The war has completely changed the conditions of lumber shipments in this province. Until two years ago a large part of our lumber was cut into deals for shipment to Europe, but no lumber goes over now. Some lumber is still exported to the United States, but there is little demand there for deals. One Parrsboro dealer has already shipped something over three million feet of spruce lumber this season, but it consisted chiefly of plank and scantling with a few deals included. Another dealer has shipped a considerable quantity of hardwood lumber by rail to American ports and to cities in Ontario. He is also shipping spruce lumber to the United States by schooner, his output being chiefly boards and scantling. A few cargoes of spruce laths have been sent to American ports by other shippers. Much more lumber would have been exported but for the difficulty of obtaining bottoms. Most of the lumber that has been shipped this season has been carried in American schooners ranging from twenty-five to fifty years. Some of them, no doubt, were laid up before the war, but they are all making money now. The trade, however, is beginning to feel the effect of the visit of the U-boats, and unless they are speedily captured or driven off they may cause considerable interruption.

Forest Fire Protection efficiency will likely be given another boost in Quebec province next year by the installation of an air patrol. Mr. Ellwood Wilson, reforestation expert of the Laurentide Company, at Grand'Mere, recently stated that it was hoped two hydroplanes would be in commission next spring watching for forest fires and equipped with wireless apparatus to get a message to the earth. The appropriation for the new machines is in the neighbourhood of \$25,000. Mr. Wilson thought the machines would be secured at the end of this year.

W. J. Taylor, Ridgetown,
President.

Chas. Hubbell, Thamesville,
Retiring President.

W. A. Hadley, Chatham,
Vice-President

B. F. Clarke, Glencoe,
Secretary.

C. M. Smith, Aylmer,
Director.

Geo. H. Belton, London,
Director.

A. W. Osborne, Sandwich,
Director.

Wm. Saunders, Dutton,
Director.

John McGibbon, Sarnia,
Director.

D. J. McEachern, Alvinston,
Director.

THE OFFICERS OF
THE SOUTHWESTERN ONTARIO RETAIL LUMBER DEALERS' ASSOCIATION

Sixty Years Service With One Firm

Wm. Power, Veteran Lumberman of Quebec, is One of the Outstanding Figures in Canadian Industry

Wm. Power, Quebec, P. Q.

Mr. William Power, of Quebec, is celebrating the 60th anniversary of his connection with the well-known lumber firm of W. & J. Sharples, of which organization he has been President for many years.

Mr. Power was born in Quebec on Feb. 21, 1847, and is the son of the late William Power, in his lifetime one of the managers of the firm of W. J. Sharples, and Bridget (Fitzgerald) Power. He was educated in the public schools and Quebec Commercial Academy, and entered the service of W. & J. Sharples after graduating from the latter scholastic institution. From the very first he attracted the attention of his employers by the steadiness of his character, and close application to business, and in a short time won their esteem and confidence, hence

his promotion was rapid, and in 1906 became a partner in the firm. He is now president of the firm, and also one of the principal owners of Riviere Ouelle Pulp & Lumber Co., as well as President of the Lafontaine Lumber Co. Mr. Power is also the owner of large timber limit lands, and one of the most respected lumber merchants in the city of Quebec.

An ex-president of the Sillery Municipal Council he was during the tercentenary celebration a member of the special committee. He also held the offices of President of the Canadian Forestry Association of Canada, Director of the Canadian Lumbermen's Association and President of the Timber Limits Association of the Province of Quebec.

Mr. Power, on July 4, 1881, married Miss Winnifred Susan Rockett, daughter of the late James Rockett, in his lifetime a well-known prominent Quebec lumber merchant. He has five sons and two daughters, one of his sons being W. Gerard Power of River Ouelle, Que., President of the Canadian Lumbermen's Association.

Mr. Power is a member of the Garrison Club, and Club Canadien, likewise of the Literary and Historical Society of Quebec, and of the Geographical, Recreation, Student of Agriculture, and a Liberal in politics. He was elected a member of the House of Commons for Quebec West, in a bye-election by acclamation in 1902, and at the general election of 1904. He was defeated in 1908 general election, and in the general election of 1911 was again elected. Mr. Power is also a member of the Quebec Board of Trade, and in 1902 and 1908 held the office of President. He is still hale and hearty in health, and conducting a very extensive business with branches in the United Kingdom and the United States. Numerous friends hope that he may be spared many more years to enjoy a life of happiness, prosperity and usefulness.

Breezy Budget from the Maritimes

Serious forest fires devastated the lumber woods of the provinces of New Brunswick and Nova Scotia. During the last week magnificent stretches of timber have been swept away in the path of the greatest enemy of the lumber operator and only a wet spell will save hundreds of thousands of dollars' worth of lumber.

An advice received on June 6 was to the effect that the whole central section of Campobello Island was being swept by a serious forest fire, causing damage to the timber lands. The blaze started in the southern section of the Island on June 5 and continued along its path of destruction right down the centre of the timber lands.

A report to the Crown Lands office in Fredericton, N.B., from one of the officials of the Department of Lands and Mines, said that a recent forest fire did damage to the amount of \$15,000 to partially manufactured lumber near Kedgewick. The blaze started in a huge pile of pulpwood, of which thousands of cords were destroyed.

A forest fire at Maltaix Siding on the Intercolonial Railway in New Brunswick has destroyed \$30,000 worth of timber. The fire is believed to have been of incendiary origin. Another large forest fire raged on the Sinclair limits on the Sevogie River, in Westmoreland County, N.B., recently.

Thomas Blundell, of Dalhousie, N.B., a well-known lumberman with George Moffat & Company, in their extensive operations in Restigouche County and with the Dalhousie Lumber Company, Limited, died recently after a brief illness.

Andrew Lamb, one of the oldest and most highly esteemed residents of St. Andrews, N.B., passed away recently at the advanced age of ninety-one years. He was born in Ayre, Scotland, and came to this country when a boy. After a trip to the diamond fields in South Africa in 1877, with his son, Mr. Lamb returned to St. Andrews and became interested in the lumber trade.

Robert Logie, Sr., one of the most highly respected and best known citizens of the Miramichi, who had been connected with the lumber industry practically all his life, died recently after a lengthy illness. He was with the J. B. Snowball concern for upwards of forty years and manager of their important Tracadie branch.

The St. John River Log Driving Company are now under way with their rafting operations at the Douglas boom, Fredericton. The Nashwaak Pulp and Paper Company are also getting under way at the mouth of the Nashwaak. Late reports from the river were to the effect that the Corporation drive was making good progress. Another drive was reported starting from Grand Falls.

Personal Paragraphs of Interest

C. McCrea, manager of the Alberta Lumber Company, Vancouver, was a recent caller upon the trade in Toronto.

F. T. Verrall of McBean & Verrall, Toronto, returned recently from a business trip through the Maritime provinces.

C. O. Maus of the Hyde Lumber Co., South Bend, Ind., was in Toronto and other cities recently, calling upon the trade.

D. McLaren, President of the Union Lumber Co., Toronto, and Mrs. McLaren, are spending the present month in California.

J. E. Littlefield of Bangor, Me., was a recent visitor to Fredericton, N.B. He is now engaged in getting out ship timbers and operates two camps in New Brunswick.

Mr. Frank Hillock, a lifelong and highly respected resident of Toronto, and a prominent lumber merchant, died recently, aged 67 years. He started to learn his trade as a carpenter at an early age. Later he entered the lumber business and then formed a partnership with Alderman John Kent as Hillock & Kent. After the death of the latter, Mr. Hillock continued the business on Albert street, from Chestnut to Elizabeth streets, Toronto. Mr. Hillock was a well-known member of Wilson Masonic Lodge and of the York Pioneers. He was also identified with the Irish Protestant Benevolent Society. Forty-seven years ago he married Margaret Wilkinson. Besides his wife he is survived by five sons and three daughters: The sons are John and Chris., of John Hillock Co., Ltd.; William, Frank and George, associated with him in business.

More Lumber Falls Prey to Flames

Much-needed showers during the latter part of May did good service in extinguishing forest fires in Nova Scotia, particularly in the northern counties. Unfortunately, the rainfall was very small, and the high winds that prevailed soon made the woods very dry again. In Lunenburg County on June 3rd a fire started from the smokestack of a sawmill at Waterloo and spread very rapidly. A pile of lumber, valued at about \$4,000, was burned and at least three dwelling houses were destroyed. On the same day a fire broke out in Queens County near Liverpool, and destroyed everything in its path, including several houses. Another fire started about the same time in the same vicinity and destroyed at least five houses, besides much other property. Most of the men in this section are away on fishing voyages, but, as both fires were comparatively near Liverpool, a number of volunteers went out from that town by automobile to help fight the flames.

On a small branch railway in Northern New Brunswick, last month, a large pile of lumber caught fire and was totally destroyed. The lumber was valued at \$30,000. It surely seems unwise to put very large quantities of lumber in one pile or in adjacent piles, especially where there is no protection against fire.

Lumbering Operations in Rossland District

Lumbering conditions in the north are very active at present, according to Mr. Joseph Deschamps, a veteran lumberman, of Rossland, who recently visited Vancouver.

The labor shortage and essential need of securing a grade of labor inferior to that of the white men hampers the operators to some extent, but at that they are "plugging away" to effect the largest possible production of finished lumber, employing the best labor they can obtain and making the best out of bad conditions.

Mr. Deschamps made a hit with his associates and throughout his district at the outbreak of war when he told every eligible man of his crews in the mills and woods that they might as well draw their time and enlist. In this manner he contributed some really valuable men to the service, finding himself hampered for labor as a result.

New Secretary for Northern District

A. J. Young, of North Bay, Ont., Who Succeeds J. A. Laberge, Has Three Sons Doing Their Bit

A. J. Young, North Bay, Ont.

A. J. Young, of the Young Lumber Company, North Bay and Toronto, the new secretary of the Northern District of the Ontario Retail Lumber Dealers' Association, succeeding J. A. Laberge, of Sudbury, who recently resigned, owing to ill health and the pressure of other duties, is, with his Mr. Young believes that these are varied interests, a very busy man. times when everyone should do his bit, and has consented to assume the duties of the position, and do all in his power to advance the interest and welfare of the retail lumbermen. He has always been an ardent supporter of trade organizations, but preferred to be a worker in the ranks rather than in office.

The Northern District Secretary has been identified with the lumber business ever since he was fourteen years old. In the early eighties he secured his first job as a road cutter and camp clerk, with Barnet and Mackie, of Pembroke, and for two years was engaged with them on their limits west of Pembroke and west of Mattawa. He learned to handle the axe, the cant hook and the peavie and helped get the timber out to the streams and start it on its journey to the mills. The next three years were spent in the service of that company at Cache Bay, Mr. Young being accountant and culler. In 1886, Barnet and Mackie sold their Sturgeon River limits to J. R. Booth, of Ottawa, and Mr. Young entered the employ of the veteran lumberman and limit holder of the Capital, with whom he remained for eighteen years. He was accountant at Cache Bay until 1891, and then became Mr. Booth's branch agent until 1904. Under his direction, from twenty to twenty-five million feet of white and red pine logs were cut every year on the Sturgeon River limits. In 1904, seeing an excellent opening for a wholesale grocery establishment in North Bay, Mr. Young entered that line, and founded a flourishing business under the name of A. J. Young, Limited, afterwards the Young Company, Limited, which he managed until 1907, when he retired, although he still retains a substantial interest in the firm, which is now known as National Grocers, Limited, with branches at North Bay, Sudbury and Sault Ste. Marie.

He also became identified with Cobalt properties, and is keenly interested in mining. In 1907 he organized, for the concentration of low grade silver ore at Cobalt, the Northern Customs Concentrators, and in 1913, along with others, took over the Wabi Iron Works, Limited, who operated a foundry and machine shop at New Liskeard. Last year an amalgamation was effected with the Boving Hydraulic and Engineering Company, of Lindsay, and Electric Steel and Metals, of Welland. The new organization is now known as Electric Steel and Engineering, Limited, of which Mr. Young is vice-president.

Three years ago the Northern Planing Mills, of North Bay, went into liquidation and the property was purchased by Mr. Young, who formed the Young Lumber Company. A large wholesale and retail business is done, while the mills turn out sash, doors and all kinds of interior trim and woodwork. Mr. Young is a large shareholder in the Auld Lumber Company, who possess timber limits in the township of Auld and have a sawmill at Latchford, Ont. He also owns an interest in the R. S. Potter Lumber Company, Limited, of Matheson, Ont., who took out a large quantity of railway ties last winter and about a million feet of logs. A new sawmill is being put in operation cutting principally jack pine.

Mr. Young has four boys, three of whom are doing their bit for King and County. Lieut. Russell Booth Young, the oldest, who was associated with his father in the lumber business at North Bay, enlisted with the 228th Battalion, C.E.F., and went overseas as a Lieutenant, the corps later being merged in the 6th Battalion, Canadian Railway Troops. He has been in France since March, 1917.

Lieut. John Francis Young, who was a third year student in mining at the School of Practical Science, Toronto, joined as a gunner in the 25th Battery, C. F. A., in March, 1915. He left for England in August of the same year and in December, 1915, secured a commission in the Royal Garrison Artillery, going to France in July, 1916, as second Lieutenant. He took part in the battles of the Somme and was promoted to a Lieutenancy, and is at present in England

taking a Battery Commander's course in the Royal Garrison Artillery.

Alfred Harold Young, the third son, signed up in March, 1915, as a gunner in the 47th Battery, and left for England in September of the same year. He secured a commission in the Royal Field Artillery in May, 1917, and crossing to France in January last came through the recent heavy fighting unscathed so far as known. He was previously a student at the University School, Toronto. Mr. Young's fourth son, Alana Edward, is not yet nineteen years of age, and it is probable that in a few months he will follow in the footsteps of his brothers by donning the King's uniform.

New Brunswick Lumbermen Get Together

A live and progressive organization of the lumbermen of New Brunswick has been effected and is the culmination of a movement which has been on foot for some time. A well attended gathering took place in St. John recently, when the matter was given greater impetus. It is felt that the unity, harmony and upbuild of the trade will be much stimulated by the get-together movement and spirit and the interest of all concerned will be fostered and strengthened.

Closer co-operation with the Crown Lands Department will result while the prevention of forest fires is one of the main objects sought. It is felt that the new organization will look after legislation affecting the lumber interests of the province and will watch carefully all that pertains to the weal and welfare of lumbermen in general.

At the recent gathering W. B. Snowball, of Chatham, presided, and there were present: F. C. Beateay, of St. John; Donald Fraser, of Plaster Rock; Daniel Richards, of Campbellton, and W. McLellan, of Fredericton, and others. It was pointed out that New Brunswick was the only province in Canada where lumbering was extensively carried on without a lumbermen's association of some kind, and while there had been at one time a Limit Holders' Association, this had not fulfilled its functions as was expected, and was finally disbanded.

The new association will include in its membership all those directly interested in the lumbering industry who desire to become identified with it. The meeting felt that a secretary should be found who would be fitted not only to give technical advice to the members of the association, but as well, keep in touch with all proposed legislation affecting the lumber industry introduced in the legislature.

Many of the larger lumber interests of the province employ expert foresters, and it was thought by those present that these men by their knowledge of the forest limits of the province might assist materially, if linked together in an association, in the prevention of disastrous forest fires.

It was suggested that a membership fee of \$10 be fixed upon and an additional fee of \$10 per million feet of lumber cut or ten cents per mile; this matter was, however, not finally settled upon. On motion it was decided to form an association to be known as the New Brunswick Lumbermen's Association. Mr. McLellan presented to the meeting a draft of a proposed constitution. It was decided to hold the next meeting of the association in Fredericton on August 1, at which details of the formation and operation of the organization would be decided upon and officers elected for the ensuing year. It was pointed out that about this date all the lumbermen in the province would visit the capital in order to pay their stumpage dues and it was therefore an opportune time to get the lumbermen together. The association aims to keep its members in close touch with the market situation so that the smaller operator will benefit by the experience of the larger concerns with a view to complete co-operation in the industry.

Will Erect New Mill and Box Factory

Another step has been taken in the development of Queensborough as the industrial section of New Westminster by the decision of the British Columbia Manufacturing Company to locate their new plant there. This company, which at present operates a box factory, has leased from the B. C. government a portion of the old provincial jail farm, on the water-front a short distance west of the present plant, and will there erect immediately a modern sawmill and box factory. The machinery has all been purchased and the work of building the new plant will commence at once.

The company finds the local box market insufficient to take the output of the large cutting capacity they intend erecting and so will equip the new mill to cut timbers for shipbuilding and railway construction as well as box lumber.

The new plant will be manned as far as possible, with returned soldiers, it being the intention of the company to co-operate to the fullest extent with vocational department of the Military Service in this work.

The mill equipment will consist of a nine-foot band mill, 14 x 32 Wickes gang saw, and all the latest accessories to saw milling and box manufacturing for economical operating.

Each Must Meet Her Own Problems

A. C. Manbert, of Toronto, Speaks of the Future Relations Between United States and the Dominion

In connection with our recent editorial, "One People in Purpose and Spirit," which referred to the remarks of retiring President M. E. Preisch, Buffalo, at the annual banquet of the National Wholesale Lumber Dealers' Association in New York in March, we have received the following communication from A. C. Manbert, of the Canadian General Lumber Company, Limited, Toronto, for years identified with the late firm of Graves, Manbert, George & Company, of Buffalo, says the New York Lumber Trade Journal.

Editor, The New York Lumber Trade Journal:

I have read with interest the editorial in your issue of May 1, "One people in purpose and spirit." The spirit of Mr. Preisch's suggestion is admirable and delightfully stated, but when he says, "We shall awaken to the fact that we are all Americans and decide to cast in our lot together and be one people," I am not quite certain if he means just what he seems to say.

I have had business relations in Canada for a number of years. I have lived here continuously for the past ten years. If I were conscious of any difference between living here and in the States that idea long ago passed away; in fact, I do not think I have ever felt any difference. When I first came here I was, of course, conscious of the strangeness of a new environment, but that was not unlike the experience in various parts of the States in which I have lived. As it is, I have come to feel so thoroughly at home and in sympathy with the Canadian viewpoint that I may be said to be a man of two countries instead of one. The ideas and aspirations of the most of Canadians that I have met are, as Mr. Preisch says, identical with those of the States, and we are, in truth, a kindred people. There is every reason, therefore, that we should co-operate and understand each other. Business relationships have laid a foundation for getting together, and made it to our interest to understand each other. The events of the past two years have taken us beyond this position of self-interest and inspired us with quickened sympathy and appreciation. We have found that we have more in common than we before knew. It is eminently desirable that we should apprehend this fact and strive for increased dignity of friendship. "Fair words butter no parsnips," and are of little use unless exemplified in actions; actions which shall exalt our individual relationships and the relationships of our separate governments in their international arrangements. Trade is the interpreter of this attitude, and anything which we can do to make trade freer and arbitrary restrictions upon commerce less will do more than volumes of glittering generalities on the subject of friendship. To my mind, if it be profitable and desirable for New York to trade with Pennsylvania and Pennsylvania with Ohio without impeding barriers, it should also be equally profitable for Ontario to trade with all three on the same conditions. I do not wish to discuss political economy, but merely state this proposition as a basis of approach. This line of thought, I fancy, is what Mr. Preisch meant. I do not anticipate that he means actual amalgamation. That would, of necessity, mean the annexation of Canada, and I am quite sure that a good many people here are not ready to be annexed. We are now fighting against the German idea on territorial rearrangement, and for the integrity of existing national conditions. The United States has her own problems within her own borders—Canada has hers that are peculiar to her population and history. My plea would be that each country meet her own problems, and in meeting them develop a dignity of attitude and a generous appreciation of her neighbor's rights, so that wherever their joint interests might touch they would be viewed and developed on the basis of fair and free purpose. Give us this, and annexation or amalgamation will not matter. If it comes it will issue out of the crying need for it; because it will be "in the nature of things" and not a measure of policy.

A. C. MANBERT.

Toronto, Can., May 20, 1918.

Some points brought out by Mr. Manbert are certainly worthy of consideration in so important a national matter. We think that in some respects he did not catch the true intent of some of our editorial remarks, which perhaps is our fault. As we caught Mr. Preisch's ideas we did not gather that amalgamation would mean the annexation of Canada, but that because of the mutual and constantly increasing interests and needs of each other we should become closer partners. Furthermore, because of the very long boundary line of

Canada, practically on the same line of latitude, she could find a much cheaper outlet for her product on lines running south and likewise could supply her needs for many things along these same shorter routes. As Mr. Preisch well points out, each country has its own problems to work out, but this is true to a greater or less extent of each state comprising the United States Union. We know that Mr. Preisch is not so much concerned just how the matter may be worked out, but his chief thought is that if both countries would devote themselves to the question of closer relations and do so in the right spirit, the matter can be worked out to a happy and successful solution, which will be of great and lasting benefit to both countries.

Famous Frame Building Will Be Preserved

"David's Temple," which was built early last century near Sharon in York County, Ontario, has been purchased by the York Pioneer and Historical Society and will be used as a museum for historic relics. It was erected under the inspiration of the late David Wilson, who was head of a religious sect known as the "Davidites," who worshipped in the unique sanctuary for many years. The structure is entirely of wood and finished in very fine white pine, which is the admiration of all sightseers. Many years ago remarkable religious ceremonies were celebrated in the Temple by the "Children of Peace," but for a long period the edifice has been unused and sadly neglected. It required six years to build the Temple, work being started in 1825, and it contains nearly three thousand panes of glass in the windows and spires and has a symbolic meaning attached to all its parts. The Temple is a three-storey building, 75 feet in height, surmounted by a gilded ball, on which is inscribed the word "Peace." The first or ground storey, which is the auditorium, is sixty feet square. The second or middle storey is a music gallery where a band of musicians rendered selections of music while the congregation were entering the building. The third storey is a dome, from which there is an open space to the ground floor. In the centre on the first floor stands a small finely finished structure, built by the late John Doan, called the Altar, and which occupied 365 days in building, and like the Temple, is square and contains the Holy Bible. It stands on twelve gilded pillars, representing the twelve apostles, and is emblematical of the religion of Christ. On the four corners of each storey of the Temple, a spire is placed, making twelve in all, and when illuminated is symbolical of the twelve apostles going out into the world to preach the salvation of Christ to the people.

The building was intended to be used fifteen times during the year, never at any time for Sunday worship, viz.: service on the last Saturday of each month, when the members made contributions for charitable purposes. It has generally been supposed that this occupied 7 years in building, after King Solomon's Temple, but such was not the case, as it was begun in 1825, and the first service was held in it October 29, 1831, making the period of erection six years. It was painted white with green facings.

Sturdy Lass Knew How to Drive Logs

"Venus" Cote, a sturdy lass living at Rimouski, Que., was arrested recently because she posed as a man, had her hair cut in military style, and went as far as donning man's attire and working in the log driving bee for the Chaleur Bay Pulp Company at Restigouche. "Venus" was in jail at Rimouski, but she escaped. After a widespread search for her through the bush and open country, a posse of Sheriff's Deputies and volunteers located her, half starved, in a barn at Ste. Angele de Morici, and she was brought back to Rimouski, where she will serve her term on a charge of vagrancy and of impersonating a man. She is 23 years old. She says she drove logs all spring in men's clothing, and was not detected till she was given away by a comrade on a spree, when the gang struck the civilized world after the log-driving season.

What B. C. Industries are Doing

The value of the output of timber products in British Columbia alone during 1917 was over \$40,000,000. For 1918 it has been conservatively estimated that this amount will be exceeded by at least \$5,000,000. In British Columbia, where by far the greatest portion of the lumbering industry is centred, there are upwards of 350 saw-mills, each with a daily capacity ranging from 40,000 feet to 300,000 feet, whose output last year exceeded 1,250,000,000 feet; about 115 shingle mills, with an estimated output in 1917 of 2,278,000,000 red cedar shingles, valued at \$7,609,854; over 1,100 active logging operators with an output for the same period of 1,660,000,000 board feet of timber; some 36 sash and door factories; 46 mills making boxes and box materials; 7 mills manufacturing cooperage stock; 5 pulp and paper mills; 6 mills making veneers; and 48 mills producing poles, posts and piles.

Will Next Year Celebrate Jubilee

John Piggott & Sons are Pioneer Retail Lumbermen Who Have Specialized on Fine Interior Woodwork

John Piggott, Windsor, Ont.

and dressed material from John Piggott & Sons, who have also supplied a number of the finest public buildings in Western Canada with all their interior finish. They are known as the pioneers of the lumber business in Western Ontario, and their reputation for prompt deliveries and the best of workmanship is excellent. In Chatham they employ an average of thirty-one hands, and in Windsor during last year, their average was forty-six.

The firm enjoy the satisfaction of having a good trade. While there has been a falling off of their sales as compared with last year, on account of the European war, they are satisfied with the year's business. They own their own wharf at Chatham, for receiving lumber,

Handling everything in the lumber line and making a specialty for a number of years of fine interior woodwork, has been the policy of John Piggott & Sons, who operate two of the most modern planing mills in Western Ontario. These are located in Windsor and Chatham. Each has a dry kiln in connection and also ample power to meet all emergencies. The firm carry a stock of pine, hemlock, cedar posts, lath, Georgia pine, yellow pine, Norway, B. C. cedar, fir and shingles, oak, plain and quarter-cut, walnut, birch and mahogany; in fact any kind of material that is required for the smallest mechanic's cottage to the most palatial mansion that is erected.

Some builders of the most expensive structures in Western Ontario have secured all the rough

Walter T. Piggott, Windsor, Ont.

Percy G. Piggott, Chatham, Ont.

posts and shingles by water, and in Windsor they have their own water-frontage.

The business was established in Chatham in 1869, by John Piggott, who is now residing in Windsor, Ont., but is not taking any active part in the management. He was born in Oxfordshire, England, and came to this country with his parents, when he was five years old, and located in Woodstock, Ont., where his father, the late Thomas Piggott, was a contractor. When John Piggott worked with him in the early days, his principal occupation was matching flooring by hand, which is quite different to-day. Mr. Piggott took an active part in military affairs at that time and he was instrumental in organizing the Woodstock Fusiliers of which he was a chartered member.

After leaving Woodstock the family settled on a farm two-and-one half miles west of Thedford, in the County of Lambton, where they together hewed the timber to get space to erect a log house in which to live. They cleared this farm, while at odd times they worked at contracting. In 1869 John Piggott moved to Chatham and started in the lumber line, with two men, a teamster, a helper and himself as the staff.

Walter T. Piggott assumed the management of the business in 1892, and since 1911 he has been devoting all his time to the Windsor end, which was purchased from W. G. Nutson in 1894, the firm taking over his entire Windsor holdings in the lumber and planing mill line. At the same time Percy G. Piggott took over the management of the Chatham factory.

The planing mill business, like every other, has its setbacks. The Windsor planing mill was burned twice, once in 1896 and the second time in 1916. While the firm carried ample fire insurance, their indirect loss, caused by the destruction of their plant, was quite an item, and is one that the average planing mill man does not consider in the operation of his business.

John Piggott & Sons have a competent staff in charge of the different departments. They take pleasure in welcoming fellow lumbermen when they call and are pleased to show them through their yard and plant, as they pride themselves on keeping their stock in the best shape.

Mr. John Piggott, the pioneer, is now seventy-five years old, and the accompanying photographs are those of himself Percy G. Piggott, and Walter T. Piggott, who constitute the firm.

Newsy Happenings from the Capital

A procession of accidents and unlooked for happenings within a period of one month, which probably constitute a record for lumbermen in Canada, befell Grant Davidson, partner and director of James Davidsons' Sons, Ottawa, and his family during May and early June. First his young son, attempting to get a ride on a wagon sustained a fractured collar bone. Next, Mrs. Davidson was taken ill and underwent hospital treatment for symptoms of pleurisy. On Friday, May 30th, Grant P. Davidson, in attempting to pull a board from a truck was injured in the abdomen and was confined to St. Luke's Hospital for about one week. During almost the same period Keith Davidson, partner of James Davidson's Sons returned to France, and Lieut. Gerald Davidson, a cousin of the owners of James Davidson's Sons, was awarded the Military Cross.

The recent placing of currants and raisins on the restricted list by Order-in-Council at Ottawa will have its effect on many lumbering camps, with the likelihood that raisin pies and pastry containing currants will disappear. Such lumbering camps and some lumbering companies who order tons of them annually will have to find substitutes in dried apples or something else. According to Mr. Frank Hawkins, secretary of Canadian Lumbermen's Association, it is the intention of the lumbering interests to see that the food regulations are lived up to and observed. Notices of the regulations and the food law will be posed in lumbering camps.

A good deal of uncertainty prevailed in Ottawa lumbering circles during the first part of June as to what attitude the Canadian railroads would take toward the increasing of their shipping rates in view of the award in the United States roads granting a twenty-five per cent. increase. Some reports were to the effect that a straight twenty-five per cent. increase above the previous advance of fifteen per cent. would be put into operation by the railways somewhere about August 1st, 1918.

Such a happening, according to other lumbermen, has not much likelihood of occurring, as they state the Board of Railway Commissioners would not sanction what would altogether mean a forty per cent. increase in freight rates within a short time. Another report was that the total increase would amount to twenty-five per cent.

No definite information as to the extent or operation of the believed expected increase in tariff had been obtained by the lumbering interests up to June 6th.

According to the secretary of the Canadian Lumbermen's Association, what Canadian shippers of lumber want is to be placed on the same plane or basis with shippers in the United States, allowing them to successfully combat competition. The first advance in the United States allowed fifteen per cent., with a maximum of one cent per hundred pounds. The Canadian increase does not provide a maximum per hundred pounds. The Canadian lumbermen want a maximum charge and are going to fight to get it.

According to Mr. Hawkins, all the Canadian lumbermen want of Canadian railroads is that the charges be the same as imposed on shippers in the United States.

Mr. Hawkins' mathematics on the situation on the basis of a twenty cent rate is as follows:

U. S. 20 cents plus 1 cent ... 21 cents per 100 lbs.

Add new rating.

21 cents with a maximum of 5 cents ... 26 cents per 100 lbs.

Canadian rates 20 cents plus 15 per cent. ... 23 cents per 100 lbs.

Add new rate of 25 per cent. ... 29 cents per 100 lbs.

Or three cents more per hundred pounds than the American rate. The difference, roughly, would amount to about \$13.50 per car. As all Canadian shippers know, the railways have abolished the quarter cent rates, retaining the half cent fraction, thus 28.75 becomes 29 per cent.

Ship Building News, East and West

The transfer of the Norton-Griffiths contract, which carries with it, it is understood, the establishment of a steel shipbuilding plant and the completion of the dry dock at Courtenay Bay, will mark an important epoch in the industrial history of St. John. The St. John Dry Dock and Shipbuilding Company, in association with the Midland Shipbuilding Company and the Great Lakes Transportation Company, are the people who propose undertaking this stupendous enterprise. Among those interested in the project are James B. Craven of New York; James Playfair, Midland, Ont.; W. H. Shepherd, Waubaushe, Ont.; Hon. Senator Richardson, Kingston, Ont.; D. White, Jr., Midland, Ont.; W. E. Phin, Hamilton, Ont.; James B. Tudhope, M.P., Orillia, Ont.; D. S. Pratt, Midland, Ont.; J. A. Paisley, Cleveland, O., and T. A. Duff, of Toronto.

Willingness to raise a corps of girls to replace men for shipbuilding work and allow them to go to the front is expressed in a letter to the Imperial Order of the Sons of the Empire, Montreal, by Miss Adelaide Clayton of Listowel, a Toronto University honor graduate, who says she can use a hammer or saw and has a natural inclination for industrial work. She writes that she would like to get useful occupation in the shipbuilding industry, and adds that she could even recruit a small company of girls to help if their energies could be used, and they could be properly and comfortably housed.

The auxiliary schooner Dornfontein, 1,400 tons, was successfully launched from yards of D. A. Saker, Strait Short, N. B., recently. This is the largest vessel ever launched from St. John yards and the first vessel of any considerable size since the olden days when wooden shipbuilding flourished in St. John. She was christened with appropriate ceremony, a distinguished gathering of citizens being present and the shores were lined with thousands of spectators for the event.

Shipbuilding on an extensive scale is foreshadowed in the formal announcement of the Minister of Marine and Fisheries, Hon. C. C. Ballantyne, concerning the new industry to be located at Halifax. While the present drydock at Halifax, damaged in the catastrophe last winter, has been acquired by the Government, and will be put into first-class condition immediately, private interests have purchased the Acadia Sugar Refinery adjoining. Three shipbuilding berths will be laid down, upon which ships of approximately 10,000 tons may be constructed. Plans for them are already receiving the attention of officers of the department, and it is expected that the first of the ships will be ready for commission inside of fifteen months. The principals in the enterprise, to be known as Halifax Shipbuilders, Limited, are represented by James Carruthers and J. W. Norcross of the Canada Steamship Lines, and R. M. Wolvin, head of the Montreal Transportation Company. They contemplate an outlay of \$3,000,000 on plant and equipment.

Among those who watched with deep interest the developments in the shipbuilding situation in Vancouver recently were the lumber men. Following the heavy demand for lumber created by the establishment of the shipbuilding industry, British Columbia's lumber industry took on a decided spurt. No less than 80,000,000 feet of high-priced lumber was required to fill the orders placed by shipyards in the province this year, this additional market for lumber presenting such a severe test on the mills that logging crews were sent into the bush to work all winter in order that the mills might keep up with the pace that had been set for them. For the present local mills are being given an opportunity to stock up, and are busy now preparing for the rush which will come again. Extra crews are working in the bush getting out special timbers for use.

Ten thousand shipbuilders have resumed work in Vancouver. The new scale of wages is retroactive from February 1st.

Mr. D. H. Ross, Canadian Trade Commissioner in Melbourne, Australia, writes in respect to the shipbuilding programme in Australia: The Commonwealth Government has purchased the shipbuilding yards of the Victorian State Government at Melbourne, but failed to come to terms with the State Government of New South Wales for the purchase of their yards at Walsh Island, Newcastle, N.S.W. However, a contract has been signed by the N. S. W. Government for the construction of six standard steamers for the Federal Government. The work is to be commenced at Walsh Island at once. At Williamstown (Melbourne) the Commonwealth Government proposes to build six standard steamers as quickly as the materials can be assembled. Acting under expert advice, the Government has adopted the "Isherwood system" of ship construction for the new steamers which are being laid down in Australia. Doubtless steamers of this class have been more familiar in Canadian than in Australian ports, hence the advantages claimed for this construction are well known to those interested in the Dominion. Six wooden ships, each of a deadweight capacity of 2,500 tons, are to be constructed for the Commonwealth Government at Sydney. The auxiliary machinery for these vessels will be made in Australia. A contract has also been signed for the building of two wooden ships for the Federal Government at Devonport, Tasmania. Negotiations are now pending for the building of steamers at

Adelaide (South Australia) and at Maryborough (Queensland). Including contracts already entered into, the present outlook is that, within a short time, arrangements will be completed for the construction of at least 20 steamers (steel and wood, respectively) for the Commonwealth Government.

Merchant tonnage completed in United Kingdom yards and entered for service during May, 1918, was 197,274 gross tons, the highest figure for any month during the past year.

Official figures published show that the completions for May marked an increase in tonnage over April, 1918, of 85,741 tons.

The next highest figures for any month in the past year were 161,674 gross tons in March, 1918.

The total completions for the twelve months ending May 31, 1918, were 1,406,838 gross tons. The corresponding figures for the year ending April 30, 1918, were 1,270,337.

U. S. Government Fixing Lumber Prices

All problems involved in price fixing are under consideration, says a recent despatch from Washington, D.C. There has been nothing definitely agreed upon as yet as to just what the retailer, wholesaler or public will pay, as the machinery is still to be worked out. Where the public buys directly from the mill it will get the lumber at the same price as the Government. Government officials seem to depend largely on the lumbermen to work out the details of price fixing.

As the situation looms up the plan is to have one price fixed on lumber for the government, the Allies and the public. This adjustment would run through mill prices, retail and wholesale prices. It is felt this would be the least complicated way to handle the matter. Under such an arrangement the present Government maximum prices presumably would be advanced considerably. One suggestion is that the price of dimension be boosted \$1.50 a thousand feet, boards \$3 and timbers \$4 to \$5. What would be a just price for all hands is a vital question and one over which the lumbermen are engaged in earnest conference.

Heretofore when the President has issued a formal order fixing prices for other commodities, they have been subject to revision at a specified time. Undoubtedly this policy will be followed in the case of lumber. All woods will be affected in time.

It is likely that the director of lumber, with a price in which the public shares, will find it necessary to add largely to his working force, and probably to establish branch offices in important lumber centres.

Is Canada's Pulpwood Supply Unlimited?

In view of the acute shortage of paper in England attention will be attracted by an article in the Board of Trade Journal on Canada's resources in pulpwood, giving facts which are supplied by the Dominion Forestry branch, that the value of Canada's exports in paper and wood-pulp are increasing rapidly, and that her wealth in woodpulp and timber, chiefly spruce, balsam, and fir is practically unlimited. These trees are largely cut for lumber, but the available quantities are ample both for that and the pulp mills.

Canadians Lead in Getting Out Timber

Chaplain Major McConnell speaks with enthusiasm of the fine work of the Canadian Forestry Corps in France. An immense amount of timber had been made available for the allies in large areas. Major McConnell found the men everywhere keen and fit, vying with one another to make new records in output, the highest reached being by one company, totalling 155,800 feet in one day.

The chaplains' department furnished for recreation, baseball and other outfits, two cinemas and lantern slides for educational work of patriotic, historical, and technical character. The chaplains' appeal for magazines and writing material for use in these areas.

Pulp Company Has Large Timber Holding

In the annual report of the North American Pulp and Paper Company it is stated that the timber limits of the Chicoutimi Pulp Co., P.Q., a subsidiary, has been increased by the acquisition of the Battle Island properties located adjacent to the timber limits of the corporation, consisting of 26,000 acres of freehold timber limits and 100,000 acres of leasehold timber limits, making a total of present holding of 561,000 acres of freehold and 700,000 acres of leasehold timber limits. The government of the Province of Quebec voted the required legislation so as to provide the raising of the water levels of Lake Kenogami at the headwaters of the Chicoutimi river. The ultimate completion of this work will enable the mechanical pulp mills to operate at their full producing capacity throughout the year.

New Inspection Rules Are Opposed

Canadian Members of the National Hardwood Lumber Association Voice their Protest Against the Proposed Changes

The proposed method of using the inspection rules of the National Hardwood Lumber Association came in for some serious criticism and objection at a meeting of the Toronto members of the Association, which was held recently. One of the advantages which Canadian members of the Association receive from identification with that body is in the application of the rules, which permit of inspection, measurement and certificate being issued at the point of shipment.

In their business relations with United States customers and owing to the presence of a National Inspector in Toronto, this system has been found to work out satisfactorily to buyer and seller. Many disputes have been obviated and a bond of confidence has been created between buyer and seller. According to the proposal which will come before the meeting in Chicago of the National Hardwood Lumber Association, which meets in that city on June 20 and 21, the Hardwood Manufacturers' Association suggest several radical changes in the adoption of the inspection rules and measurement of hardwood lumber at the point of shipment and the issuance of the official certificate. The contemplated alterations were referred to at considerable length in the last issue of the "Canada Lumberman," and, in brief, the radical departures suggested are that official inspection and measurement should be abolished at the point of origin; that in the event of disagreement between buyer and seller, official inspection shall only be available with the consent of the seller and that the official interpretation and application of the rules shall be left to a small and unrepresentative committee, who shall have all matters relating to the hiring and discharging of inspectors vested solely in them.

These three clauses were vigorously opposed by the Toronto members, and the sentiment of the meeting was to the effect that if the inspection service, present grading rules and certificate were wiped away that membership in the National Hardwood Lumber Association would prove practically of no value or assistance to them. A number of Canadians will attend the Chicago convention and vote against the proposal, which is regarded as one-sided and manifestly unfair.

The result of the recent session was the unanimous passing of a resolution expressing the opposition of the Toronto members to the three clauses of the resolution passed by the Board of Governors of the Hardwood Manufacturers' Association at Cincinnati on April 30th, but approving of the sentiments of loyalty expressed in the preamble.

The resolution carried was as follows:—

Moved by W. C. Gall, seconded by Joseph Oliver, and carried unanimously, that We, the Toronto members of the National Hardwood Lumber Association, having met on June 4th, wish heartily to endorse the principle of maintaining a uniform set of grading rules on hardwood lumber for Canada and the United States, and we also wish to pledge our support and co-operation to the respective governments of the United States and Great Britain in doing everything possible to assist in the furtherance of the welfare of the allies; but we do feel that clauses 1, 2 and 3, as presented by the Hardwood Manufacturers' Association mean the destruction of the principles of fair play and harmony between buyers and sellers of lumber, and therefore we pledge ourselves to oppose the resolution.

Those represented at the meeting were: The C. G. Anderson Lumber Co., the Atlantic Lumber Co., Robert Bury & Co., Canada, Ltd., Edward Clark & Sons, Ltd., the Gall Lumber Co., Hart & McDonagh, the William Laking Lumber Co., the Johnston Lumber Co., McBean & Verrall; the Oliver Lumber Co.; and the Seaman Kent Co., Ltd. Mr. W. J. Hetherington, of the William Laking Lumber Co., occupied the chair.

Should Develop More Home Material

Mr. William Rutherford, of William Rutherford & Sons Company, Limited, in his address as retiring president of the Montreal branch of the Canadian Manufacturers' Association, urged that the early war time slogan, "Business as usual," was impractical now, and that the past four years had shown that business men must concentrate to meet present day demands. He emphasized the fact that the country was too dependent upon outside sources for material which could be obtained within its own borders, and declared that the government should exercise wisdom in its taxation laws in order not to discourage foreign capital from investing here.

A better understanding between capital and labor was urged by Mr. Rutherford, who said that maximum production could not be attained unless the efforts of masters and men were co-ordinated. In

this connection he suggested arbitration as a means of adjusting industrial disputes, and by this avoid that stoppage of production which has been so disastrous in the past in many parts of Canada and the United States.

Lieut.-Col. Sadler, of Sadler & Haworth, was elected vice-president, and among the representatives of the branch on the executive council are Messrs. W. Rutherford, J. H. Sherrard, and Geo. W. Sadler.

Fire Destroys Saw Mill at Victoria Harbor

The timber and specialty mill, known as No. 1 mill, at the west end of Victoria Harbor, Ont., owned by the Victoria Harbor Lumber Company, was destroyed by fire during a severe electric storm on May 27. The frame structure was consumed, in spite of the excellent work rendered by the volunteer fire brigade of the company, which maintains a pumping station and splendid fire-fighting apparatus. The roof of the boiler house adjoining was burned, and although the smokestack fell on the planing mill contiguous, that structure was saved and is again in operation. The burned mill, which is one of three owned by the firm at Victoria Harbor, was built over a quarter of a century ago and was a single band sawmill with a cutting capacity of about 50,000 feet a day. The lath and shingle departments were also wiped out. The loss is estimated at \$50,000, which is practically covered by insurance. No lumber was lost. There will be no interruption to the output of the company as their No. 3 mill, which has an output of 120,000 feet a day, is in full operation cutting white and red pine.

During the same storm the stables of the Georgian Bay Lumber Company at Waubashene were struck and consumed. The horses were all taken out in time, but a quantity of feed was destroyed.

Canadian Lumberjacks Cut Down Stately Trees

The Canadian Y.M.C.A. with the Overseas Military Forces of Canada is conducting a big work for the men of the Canadian Forestry Corps in Great Britain and France. Here and there in the romantic old forests of England, up among the Highlands far north in Scotland and in the forests of our sister ally France, are located camps of Canadian lumbermen in khaki. These soldier lumberjacks

How the lumberjacks in the Canadian Forestry Corps keep fit and active
They have a splendid foot-ball club.

are busily engaged in rendering the stately trees, upon which the profane hands of man probably never would have been laid but for the war, into timber for various uses at the front.

Within the confines of the city of London at Catford, is one of these stations of the Canadian Forestry Corps, which is served by the men of the Red Triangle. At Catford no timber cutting is done, the camp being used for the setting up and assembling of the mills which eventually find their way into the outlying forests, where cutting is in progress. The Y.M.C.A. centre at Catford is styled "The Canadian Forestry Club," and is carrying on a useful work in a social way, for the men stationed there.

The Timberland Lumber Company, New Westminster, B.C., have plans drawn for the erection of a sawmill on the south side of the Fraser River, opposite city. The work will be done by day labor and the mill will have a capacity of 100,000 feet per day.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Wanted

Cedar, Oak and Hemlock Ties, Sawmill and Planing Mill Sawdust. Apply Hamilton Lumber & Coal Co., Limited, Hamilton, Ont. 12-12

Wanted

Sawdust, dry and green. Hemlock and Cedar Ties. Cull Basswood. 1 x 4 Cull Red, White and Jack Pine. Apply Box 743, Canada Lumberman, Toronto. 12-12

Trimmer Ends Wanted

White Pine, Red Pine and Spruce, 1917 or 1918 cut. Write stating approximately what you have. Give thickness, conditions as to color, worms, etc. Box 738, Canada Lumberman, Toronto, Ont. 10-15

Lumber Wanted

100 M. 2 x 6 Mill Cull Spruce.
100 M. 2 x 4 and wider Mill Cull Spruce.
100 M. 1 x 4 and wider Mill Cull Spruce.
200 M. 1 x 4 and wider No. 2 & 3 Com. Birch.
Quote prices for cash.

1-18 ft. 2-saw trimmer and saws.
1-2-block carriage, set works, track and rope feed.
1-Husk arbor, etc.
1-Bull wheel, shafting, etc.
1-Cut off saw and arbor.
1-Covel No. 35 automatic saw gummer.
1-Lumber car, track, miscellaneous shafting, belting, pulleys, etc.
1-Complete blacksmith outfit and two chests of tools.
All for sale, F.O.B. boat or cars Sault Ste. Marie, Ont. Will sell in block or separate items.
Address for further information:—

SHELBY BASKET COMPANY,
10-tf Shelby, Mich.

Steam Equipment For Sale

Steam Power Equipment in A1 condition, consisting of the following:

BOILER

1-Horizontal Fire Tube, Goldie & McCulloch 60 in. x 14 ft., 74 3-in. flues, 100 lbs. normal pressure.

ENGINE

1 Goldie & McCulloch "Ideal" tandem compound horizontal, style T.C. 10 in. and 16 in. x 12 in. stroke, 100 lbs. pressure, 300 r.p.m., 60 in. x 10 in. flyball governor wheel and 60 in x 12 in. belt pulley.

ADDITIONAL EQUIPMENT

1-Belt-driven Goldie & McCulloch Condenser and Pump; Horizontal Action.

1-Horizontal Feedwater Heater, Goldie & McCulloch No. 18.

1-Vertical Belt-driven Feed Pump, with loose pulley and adjustable crank.

All of the above equipment is in first class shape and was removed to make room for a sub-station of the Hydro-electric Power Commission. For further information address,

The Smith's Falls Hydro-Electric System,
11-14 Smith's Falls, Ont.

Wanted-Machinery

Wanted

Second-hand Chain, 3/4 in., 1 in., 1 1/4 in., 1 1/2 in., boom shackles for same, wire rope, same sizes, black pipe, 2 to 5 in. State lengths. Will pay cash.

D. G. RHEAULT,
13-13 Mont Joli, Que.

Wanted-Employment

The Biggest Wooden Ship Ever Built

No ship in years has aroused such interest as the War Mystery, the wooden steamer recently launched at a Texas port for the Cunard Steamship Company. The fact that it is the largest wooden steamship ever built is sufficient to excite much comment in ship-building circles, but is of an entirely new type of construction from all wooden vessels which have preceded her.

In design and construction she and her sister ship, the War Marvel, differ radically from the Ferris type of wooden ship which has been adopted by the United States Emergency Fleet Corporation, and which is familiar to all ship-builders. One of the principal differences is that the War Mystery has a deadweight carrying capacity of 4,700 tons, as compared with 3,500 tons of the Ferris type; yet the larger vessel requires less than 1,500,000 feet of material to construct, as compared with approximately 1,750,000 feet required for the Ferris ship.

The vessel is not intended to carry sail, and the masts will be

derrick posts, 45 feet in height, built to fold down upon the deck, so as to lessen the visibility of the ship and reduce the danger of being accurately located at a distance by enemy vessels. The War Mystery and the sister vessels of her type have been given an A1 rating by Lloyd's. The officers of the National Company say they can produce ships of the War Mystery type within thirty days after construction begins, and, since the company has ways for eight vessels, the future production will be at the rate of thirty-two ships annually.

Wood Waste Serving No Good Purpose

There are more than 48,000 sawmills in the United States, according to the Forest Service, and their output of waste in the form of sawdust, shavings, slabs, and other wood refuse is estimated at 36,000,000 cords per year, equal to over 4,500,000,000 cubic feet of waste. Considering each cord to contain 80 cubic feet of solid wood with all the cracks and air spaces taken out, these 36,000,000 cords would make a block of wood more than a quarter of a mile on each edge.

Perhaps one-half of this so-called waste is not strictly speaking waste, but, serves a useful purpose as fuel under the boilers. Much of the remaining 18,000,000 cords not only serve no useful purpose, but in most cases are a source of inconvenience and danger, and cost the mill time and money.

Sawmill waste is disposed of in various ways. Some goes to the local fuel market, some to pulp mills or to wood distillation plants. Shavings and hog cuttings, as well as other mill waste, are sometimes used to fill low places in the yard. However, the most common method of getting rid of waste is by burning.

Why Should Not Canada Build Houses?

Frank Fairman, of Toronto, writing on the subject of landlords, and the housing problem, thinks there is no valid reason why the federal or provincial governments should not undertake the erection of a large number of dwellings to meet the urgent need of housing accommodation at many centres. Mr. Fairman says that Canadian cities have grown haphazard at the mercy of unrestricted landlords, jerry-builders and railway companies. They have not been directed on scientific lines. Town-planning can be the hand-maid of trade. It can make cities prosperous as well as stately.

There are two very urgent things to be done; to check speculation and prevent forced prices. For these are the things which ul-

timately have to be paid for in rent. Why should people be content to pay for the rental of a house eight, ten, or even twelve per cent., on the capital sunk in building it?

If "the foundations of the national glory are set in the homes of the people," then the people should and must have good, substantial, healthy dwellings. The same principle that is applied in the making of a warship should be applied to house-building, and that is efficiency; and not merely making profit at the expense of the householder.

Nearly all the houses which are now built are made by small capitalists, with borrowed money, for which exorbitant rates of interest have to be paid. Again, houses are usually built a few at a time, and the work is uneconomic because done on a small scale.

Why should not the nation build say 5,000 houses or more at a time? Why not a housing budget, the same as any other budget? It is no use for ignorant critics to say it can't be done. It can be done if the governments look further than their noses. If a grand national housing scheme were put into effect we could swiftly change the face of our society, banish disease and lengthen life, etc. That foolish policy of our grandparents, who held that it was undesirable to interfere with the rights of property or the "free contract" of landlord and tenant is passing.

PEDWELL HARDWOOD LUMBER CO.

79 Spadina Ave - TORONTO

Review of Current Trade Conditions

Ontario.

Business in all lines of the lumber trade is reported fair and those firms which have an established connection with the United States or Canadian Governments report that orders are specially good on lumber used for trucks, etc. In the Dominion there has been a lull in the number of consignments for hardwood during the past few days owing to the fact that manufacturing establishments are pretty well stocked up and are not entering the market at the present time. All the cuts of hardwood for the coming season have been practically bought up, and there is a scarcity in some lines, particularly oak, maple and birch.

In soft woods, while there is no sign of quotations declining there is little buying going on. Stocks with wholesalers are in some instances low. The majority of them are still holding aloof, not caring to take chances on the market and preferring not to load up. Whether values will decrease or not is a matter of conjecture. The mill men are still firm in their attitude. Of course, there is always a quietness during the mid-summer season which is now approaching and building has not taken on any very marked activity of late, although much is heard about housing commissions, municipal domiciling schemes and other plans. It is stated by some architects in Toronto that the cost of building has practically doubled within the last eight years when lumber, hardware, plumbing, steel, labor and wages are taken into consideration. The statement was made recently that an \$8,000 residence would cost 14½¢ per cubic foot in 1910 as compared with 17½¢ per cubic foot in 1912, and 27 to 28¢ per cubic foot in 1918.

In regard to the labor situation there are varying reports. At some points men are more numerous than required, while at other centres there is talk of closing down the mills after the first of August owing to the shortage in the supply of logs and the fact that some plants expect to be up against it for help, particularly when the harvest excursions start for the west. There is always a migratory class of the population and this wandering spirit manifests itself by the end of July. The help question is so perplexing at some points that no shipping department is equipped, and men from the mills have to load cars in the evening after their day's work is done. While they are not averse to the extra money for a while, it is felt that they will not long endure such conditions.

Some big sales of white pine have been reported, one Montreal firm contracting with an eastern Ontario company for their entire cut of 75,000,000 feet while, it is understood, an Ottawa mill has withdrawn all quotations on white pine and hemlock owing to the orders in hand. The water situation is not improving and many streams are falling to a low level at a particularly early period. Dry stock is reported very scarce and there is also some difficulty in getting crating and box lumber. Most firms are, however, pretty well stocked up.

The transportation situation is very good at present, although there are some embargoes on the other side, particularly in New York State, which reduce shipments, and permits have to be secured by the consignee which must be handed over to the carrying company in order to get lumber into New York, Philadelphia and Baltimore. Considerable interest has been manifested in Canada in the report which is heard on all sides that the American Government intend fixing the price of lumber in all commercial transactions. The increased freight rate of 25 per cent. goes into effect across the border next week, and this may be followed sooner or later by a similar advance on the part of Canadian roads, although it is only a few weeks since the 15 per cent jump was sanctioned. The fact that transportation charges are increasing all the time and the cut in the woods will be appreciably less this season than ever, owing to labor difficulties, wages and maintenance indicate a decreased production of timber which will have the effect of keeping prices up.

While it is true that the law of supply and demand regulates the figure at which lumber must be disposed of, and that the demand is not very keen at present except on government business, there is not enough stock coming on the market to cause any radical change in the prospective situation, so far as quotations are concerned. This is the view taken by those who have given considerable thought and study to the conditions underlying and governing the conversion of the forest into the finished product.

Business with the retail lumber yards is rather quiet, but farmers expect to start building as soon as they are assured of a good crop. The harvest outlook at present is encouraging. On the whole the market situation may be said to be in a somewhat mark-time state with no decided development in any direction.

The demand for B. C. products which was rather quiet during the past month, has reasserted itself, and eastern representatives report several good sales. There is little or nothing doing in lath owing to the lull in building, and a small advance on B. C. red cedar shingles is reported.

United States.

The chief topic of interest at this juncture in the probable fixing of all lumber prices by the government. As far as the lumber trade is concerned, a survey of the situation yields the conclusion that all factors are agreed on one point: That if prices on commercial lumber are to be fixed at all, they should be fixed to the consumer as well as to the trade. Generally speaking, the mill operators are opposed to any price-fixing move, while the wholesalers are on record as not opposing it and some of the retailers have come out in favor of it.

The hardwood market is quite firm. Demand continues good for practically every item on the list. There is an exceptional call, however, for thick oak, for the higher grades of quartered white oak and oak veneers, for the lower grades of cotton wood and gum, and for all grades of ash and hickory.

A larger movement is noted recently in red gum, the principal buyers being furniture interests and those identified with the building industry. There is quite a good movement at full prices in sap gum in the higher grades as well as in firsts and seconds cotton wood. Box boards are scarce and prices thereon are exceptionally well maintained because of the strained relations between supply and demand.

The high note in the yellow pine market was struck by the distribution of orders among the mills for from three to four hundred million feet of materials for the building of the hundred thousand cars recently ordered by the Government. These cars are to be steel and wood construction. This order, together with the 300,000,000 feet recently placed for the building of cantonments, and with another prospective 200,000,000 feet to be ordered by the Government, will take the entire time of the yellow pine mills for some period ahead. It will also strip still more a market that is already short of inch and two-inch lumber.

It is a question whether or not the opening of the eastern territory will make much difference as matters now stand, as the stocks at the mills are not large, production is distinctly curtailed by labor shortage, cars are still not plentiful, and doubtless will not be, and the request of the Government to the mills to hold their lumber will have a tendency to lessen any anxiety the mill man may feel toward making use of the lifting of the embargoes.

Little or no change is reported in conditions in the hemlock industry. This wood is moving in good volume into the eastern distributing centres, and there also is a good local and country yard demand.

All items on the hardwood lists are moving into the factories engaged in the manufacture of war products. The demand for low grade maple, basswood and birch continues satisfactory, the bulk of the receipts going into the box and crating industries. The implement and wagon factories are in the market for the upper grades, and it is reported there also is a growing demand for the species mentioned from the showcase and furniture manufacturers.

Red cedar shingles have recently advanced and promise to remain firm, but it must be remembered that this market is a very temperamental one. A rising tendency, noticeable in all lumber centres, finds expression in higher quotations on stocks in general demand from different sections of the country.

Do you know that there are more than two million men engaged directly and indirectly in or depending upon the industry—that the lumber family is the biggest family or tribe of manufacturing people in the United States, says "Lumber". There is quite an interesting and valuable book issued by the Bureau of the Census, known as the Abstract of the Census of Manufacturers for 1914, which furnishes some stubborn facts that merit thoughtful attention these days.

Sawmilling—lumber and timber products, 536,116; planing mills, not connected with sawmill, 115,969; basket making, 5,362; boxes—cigar, 42,218; cooperage, 19,585; furniture, 145,627; musical instruments (not talking machines), 41,723; wood, turned and carved, 13,396; lasts, 2,489; matches, 4,546; pencils, 4,760; sewing machine cases, 3,838; window screens and window strips, 3,967; wood carpets, 192; wood distillation, 3,142; wood preserving, 3,454; wooden goods not elsewhere specified, 7,183; paper and wood pulp, 95,516; phonographs, 11,366; wooden ships and boat building, 13,003; total, 1,070,173. This tabulation shows a total somewhat above a million and nearly

another million is made up of the following items garnered from other tables in the census report: Carpenters, 817,082; cabinet makers, 41,884.

Great Britain.

The trade in American hardwood has undergone no change, and the restrictions of sending such wood as dunage have apparently not made any appreciable difference to the shipping of such woods as are really needed. The arrival list is a rather lengthy and varied one, the most noticeable feature being that for the 15 parcels to hand there are only five receivers, and that one firm alone accounts for two-thirds of the number of shipments which have arrived. A fair quantity of walnut figures in the list, a good deal of oak and whitewood, some hazel pine and a little ash.

The past week has been a very troublesome one for merchants and importers, says the Timber Trades Journal. Needless to say, there has been no attempt to do fresh business, but owing to the arbitrary refusal to allow contracts already entered into to be fulfilled without special permission, the Controller has given himself a lot of trouble, and has caused much anxiety in the trade. The Order issued by the Board of Trade cannot be said to be a hurried production, as it has been threatened and expected for weeks; and yet we hear of cases where importers have paid personal visits to the Controller's Department, and have been unable to get a clear explanation of the position in which they stand. We stated recently that we did not anticipate an arbitrary use of the powers secured; and we understand that most firms are finding, after a considerable amount of trouble perhaps, that a reasonable view is taken; but the new powers certainly permit of arbitrary action, and place the trade in the position of having to ask for

favours from the authorities. When licenses were applied for, previous to the Order, the terms on which they were granted were well known, and merchants felt that they had the right to demand such licenses when they fulfilled the conditions stipulated for by the Controller. Now the whole question has been re-opened, and importers must obtain permission for what is practically a license to use a license.

A recent report from Liverpool says: As the war progresses, the position of the imported timber trade becomes more and more acute. From time to time a fresh edict emanates from the Controller of Timber Supplies, which has the effect of still further tightening up the trend of business in all kinds of timber. As far as private trading is concerned, this is practically at a standstill, and the only business done now is in timber required for Government work or for needs of national importance. To a large extent even this class of trade is becoming narrowed down through the extension of timber imported by the Government direct, and the recent Order prohibiting dealing in stocks of timber grown outside the United Kingdom, and not actually in stock in the United Kingdom, without a permit is bound to have a serious effect upon the small amount of business which is still being conducted in imported woods. We are still further informed that this Order is expected to be followed by another regulating not only dealing in timber, but also its use in this country, whether grown outside or inside the United Kingdom. This is tantamount to the complete obliteration of all private trading, and for the future only work of national importance will be recognized in the sale and distribution of timber of any kind. This is, indeed, a very drastic proposition, and is bound to hit a large number of timber merchants, who have latterly managed to keep things moving by dealing in the small parcels of American hardwoods which have been shipped here as "dunnage" or as "deck cargo."

Movements of Stock Slow at St. John

When one talks of the market they always suggest a movement of stocks. It cannot be said that this applies to lumber at the present. In as far as St. John is concerned it may be stated that during the last few months very little change, if any, has taken place in St. John markets. Some time—in the near future it is hoped—that a door may be opened large enough to allow some movement of stocks now accumulating. All over this immediate section more than one American buyer has come into this market and told stories which, if correct, are seemingly very much out of place at the present time. It was stated that the United States government is not going to allow Canadian lumber to be shipped into the United States; however, no large quantity of lumber is being produced this season, and probably if no stock is moved in the near future the mills will be compelled to close down for want of piling space. Two mills at St. John have practically all the lumber which they sawed last season, besides what they have sawed to date, and if not relieved shortly they must close up. Prices remain unchanged. Boards are scarce, especially good, dry boards, which are bringing from \$30 to \$35.00.

The factories are matching spruce boards as fast as they can procure them. The mills are sawing practically all English deals, but as no space is to be procured for shipment across, the only market to depend up is the American, and at present writing some buyers seem disposed to meet the manufacturer's price, while others are not disposed to purchase at all. Random Spruce is bringing about 30.00 per thousand, 2 x 3 and 3 x 3 to 12 inches f.o.b. cars, St. John, but only very limited sales have taken place. It is really hard to mouth business. Pine stocks at St. John are very much depleted. Some mills are entirely out of stock and good prices are being realized. Laths are weak and \$3.00 seems to be the price for f.o.b. Shingles have not held up to expectation, even though the production at St. John is very limited; only six machines are being operated and, even at this rate the better grades, and very lowest grades are not being taken care of. Prices are asked but not always received. The box trade and stave and heading business is very active and a good market is being found for all that can be procured. The log drives on the main St. John are all below Grand Falls, but with the quick drop in the river during the last two weeks many logs are piled on the bars and against the bridge piers. Large numbers of drivers are now packing the logs into midstream, where the water is still good and it is to be hoped that all the logs will reach the booms. So far the spring has not brought any serious forest fires in the timber at any points along the St. John river. Any fires which were at all dangerous were extinguished by the heavy rains of June 7th.

Montreal Looks for Increased Prices

Business in Montreal has picked up, although wholesalers who do mainly a local trade state that orders are few owing to the slackness in building. The permits, however, are of a more encouraging character, with reports that additional work of a fairly substantial nature is likely to be put in hand. The permits in May were helped by work for munitions purposes. On the other side, a job of importance, in which lumber was a considerable item, has been postponed because the tenders proved to be much higher than had been anticipated. During May the permits totalled \$658,680, a gain of \$168,626; those for the five months were \$1,742,005, a decrease of \$366,909.

Prices continue very stiff, and while some wholesalers believe that the market will strengthen a little, others are of opinion that an appreciable rise will be seen. This view is based on considerations of the high cost of production, heavier charges of handling, and an increase in the demand, mainly from the United States. In discussing the fixing of lumber prices in that country, it was conceded that this would affect Canadian trade, one wholesaler stating that in his view it would tend to stabilize conditions. Inquiries from over the border have increased, the freer movement of shipments helping this section of the market.

Trade in B. C. lumber has shown a little more life. Pulpwood is in steady request, with prices a shade lower.

The embargo on veneers is naturally affecting that branch of the trade. The demand is fair, but stock is very difficult to secure.

A small quantity of lumber is being shipped to the United Kingdom for government account. The British Government has decided that no more deck cargoes of lumber are to be allowed, thus further curtailing chances of exports from this side. Besides that, an order has been issued prohibiting any transaction in lumber grown outside the United Kingdom and not actually in stock, except under a permit from the Controller of Timber Supplies. The order, which is the result of prolonged negotiations between the lumber trade and the Controller, affects virtually the whole importation of timber, and, says a British despatch, is intended, while not interfering with the normal trade of lumber producers, to prevent speculative transactions.

The sulphite market is buoyant, with supplies scarce. The outlook is for higher prices, due to increased costs for production and materials.

If you are after business, cater to the farmer, for he has the money, and is going to get more than his share for the next two or three years to come. GET BUSY.

Economy that entails no hardship

In your camp milk economy can be practised without discomfort or sacrifice by the simple expedient of using Klim in place of any other form of milk.

Klim is pasteurized separated milk in powder form. It is body-building food—casein, albumen, milk sugar and salts of milk in powder form, made by removing the water content of the original separated milk. The natural milk flavor is retained.

Klim costs less per gallon than any other form of milk. It bulks small and weighs little, saving 50 per cent. to 75 per cent. on freight bills and requiring little space for storage. It will keep sweet and fresh indefinitely without refrigeration.

Use Klim always. It will save you money without depriving your men of any accustomed food recipe in which milk is used.

Conflicting Reports from Ottawa Valley

A general slackening in the volume of business done was apparently evident in the Ottawa lumber market during the opening period of June. Reports from trade sources on this point conflicted. Some companies and mills said orders were keeping up, whilst others mentioned a considerable falling off in American demand.

Despite the reported drop in orders and inquiries, the market, as to price, remained absolutely firm. Stocks, especially dry were very low. A general shortage did not ensue. The position seemed to be that if a buyer hunted long enough he could finally locate the dry stock in the dimensions he desired, and could purchase it providing he was willing to pay the price demanded, which was high.

There was less dry stock in the yards and on hand during early June this year than during a corresponding period in other years. In the manufacturers' yards little if any stock remained unsold and some reports were that everything the manufacturers had, had been sold close up to the saw.

All indications pointed that reserves of sawn lumber were running low, and the usual log reserves in the river were being called upon. With the annual reserves being already tapped and considering the decreased cut in the woods last winter the outlook for a normal sawing cut was not bright.

In a nutshell the situation is self explanatory, as during the past two seasons, if not three, woods operations have not been conducted on the same scale they were in pre war years. A shortage of labor and the high cost of logging were two of the essential contributing factors. Consequently the number of logs available at the streams were less. The demand for sawn dry and wet lumber kept up, with the result that the reserve the manufacturers usually carried was drawn upon, and was gradually pretty well consumed. Then again the cut of the sawmills for two years has been lessened, and what was taken away in the first two, of the three year period, was not altogether restored. The call for shell box stock caused a heavy drain which woods operations hardly kept pace with.

The result of sales and decreased operations of two years ago are making themselves felt. The situation is that the manufacturers had to sell much closer up on their sawing production this year, than for many years. The logs to ensure the normal sawing operations were not in sight. One manufacturer which always kept from fifty to sixty thousand logs boomed at his mill, was compelled to call upon them early in June. John R. Booth has not operated his sawmill at night for two years with the result his production is cut away down, yet a fairly heavy demand continued.

The majority of opinions expressed in manufacturing circles is that lumber is growing scarce and bound to grow scarcer. If even a fair demand asserts itself for the next twelve months there seems no reason at all why prices should not substantially advance. The total sawmill cut of Ottawa district mills will likely be even lower than that of last year.

Divergent views were expressed among those members of the trade who reported a falling off in orders. The sum and substance of one interpretation was that the improved condition of transportation in United States and decreasing congestion on railway lines and terminals had brought about a sufficiently satisfactory condition to permit American grown lumber to be shipped and quickly forwarded to its destination.

Thereby consumers in the United States would use their native-grown stock, tending to lessen the demand for the Canadian growth. In other words, the United States was enabled through the improvement in transportation to use a U.S.A. product, as against the time when congestion on American railways was in vogue and the lumber being absolutely necessary, the business came to Canada.

As against such an argument there is advanced by some big shippers in the Ottawa Valley that rail transportation in Canada has also improved and Canadian stocks ordered months ago are moving more freely, with the result that United States yards and users are getting fast delivery of the delayed stock, and have an adequate amount on hand. Hence a cessation of orders till a new demand arises.

The stability of the market is surprisingly shown by the continued firmness of it as to price. The drop in orders did not effect the price in any way as compared with the period when orders were plentiful and transportation bad. Lumbermen generally agreed that there were no indications to warrant a decline. The view was expressed that if the war ended to-morrow that no change in the cost of labor or the cost of production would take place from twelve to eighteen months.

A large number of foreign cars became available to shippers during the latter part of May and early June, with the result that previously purchased stocks began to move very freely. The transportation situation was classified as being "good." The labor situation showed no change.

The supply of logs from the Uuuer Ottawa picked up somewhat, due to the arrival of the northern waters, which were not as high as usual. Prospects of low water this summer continued to cause the

manufacturers considerable concern. One manufacturer reported his firm as taking advantage of all holidays to shut down the sawmill and increase the "bank" of logs. The mill has only a three day supply of logs on hand.

With the woodworking plants the manufacturers of shell boxes were hopeful during the first week of June of getting a share of a very large contract for boxes about to be let. The number will likely be over a million and might approach two million. The principal part of the contract will centre on the two rund, six in box. Rumors that a portion would be for the nine in box were heard. Quite a few of the woodworking plants in the Ottawa district put in tenders which closed on Friday, June 7th. The award of the Imperial Munitions Board was expected to be announced anywhere from May 10th to 15th.

An order for 3,000 large boxes, consuming about 200,000 feet of lumber for the Dominion Government was received by James Davidson's sons.

Dunnage Timber and Deck Cargoes

The Board of Trade hereby give notice that the general licenses permitting the importation of timber when carried as dunnage or when brought as deck cargo from America and Canadian ports has been revoked, says the "Timber Trades Journal."

Shippers of timber are advised to communicate with the Controller of Timber Supplies, Caxton House, Tothill Street, S.W. 1, in regard to all shipments of timber as dunnage or as deck cargo which may take place after that date.

The above Order, revoking the concession by which American and Canadian goods were allowed to be imported without license if carried as deck or dunnage cargo, will be regretfully read by the hardwood trade at large. The sundry parcels that have, from time to time, come forward since the concession was granted have materially assisted in helping to keep matters in progress in the trade. They have besides been of great benefit to the Government themselves, inasmuch as they have been in great demand in assisting in the execution and speedy output of many Service requirements. Like other orders and restrictions from which we suffer, we must bow to the inevitable, and extract what consolation we may find in the second paragraph of the new Order. From this we gather, if we read aright, that some shipments, brought forward as dunnage or deck cargo, will be allowed if authority or license is first obtained.

Maritime Cut Forty Per Cent Less

The lumber cut throughout the Maritime provinces last winter was far from being up to the average. In New Brunswick there was a reduction in the annual cut of at least 40 per cent. This was due to several reasons: the heavy snow fall that came early last fall before the swamps and ground were frozen, and remained on until early spring, prevented successful operations. The shortage of cars also hindered shipments to the United States and Canada and the British and French markets were completely cut off owing to lack of shipping and this applied largely to the United States, when all the available shipping was placed under an embargo to aid in relieving the railway congestion.

Taking Cumberland County, N.S., the cut was the smallest in its history for many years. Taking the West Bay Section from Bass River in Colchester to Apple River, the cut was almost entirely limited to ship timber that is being utilized for the building of wooden ships this spring and summer. Between the points mentioned fourteen vessels are on the stocks. This is furnishing labor in abundance to the men in that section of Cumberland and Colchester. The outlook for the coming winter is far from being bright. The foreign market is not promising.

Labor Conditions Hold Back Lumbering

Hon. John Oliver, Premier of British Columbia, who was recently in Toronto, in an interview said: "Our industries on the whole are very active, but the labor market is in a bad state. There is a big need of men. While the lumber cut has not been so big as might be expected, the mills are active and working to the limit of the labor power at their disposal." Mr. Oliver declared the inability to get needed supplies for all the industries is causing some mills to forcibly reduce their output. Many industries, he added, find it difficult to get tools; such a necessity as wire cable, used extensively in the lumber business, is very hard to obtain.

"Airplane building in Canada has meant much for the British Columbia spruce lumber cutting. As this is needed for the framework of airplanes, the British Columbia Government stepped in to help the Government, or Munitions Board, at Ottawa, as well as the lumber cutters. The price was equitably fixed so that the lumbermen would get a fair price, and also that the authorities would not be held up for extortionate charges.

Canada's Achievement in Ship Building

"The return of new merchant ships completed in May," says the London (Eng.) Times, "shows a great advance on the previous month, and this is not the only proof of the energy now being thrown into shipbuilding. 'According to the chairman of the Imperial Munitions Board, there is in Canada one-quarter of the total merchant tonnage produced by the United Kingdom in 1917, and four-fifths of it will be completed this year. That is the remarkable achievement for a country in which ten years ago shipbuilding hardly existed in embryo. All this enterprise will bear fruit in due course, and before this time next year the shipping position will be totally different from that of to-day.'" Archibald Hurd, writing in the Daily Telegraph, says the output of British tonnage during the twelve months ending May 31 was almost exactly twice that of the preceding twelve months. He continues: "Since the spring of last year the progress has been consistent and steady, if not swift. It has been marked by no sensational development, and will be marked by none."

Shipbuilding yards are to be established on a large scale in Halifax and those interested in the venture, which involves an expenditure of \$3,000,000 on plant and equipment, have completed arrangements with the department of marine. The Halifax dry dock, which suffered some damage in the great fire, has been acquired by the government and will shortly be in condition to receive ships of the largest class for repairs. The adjoining property, formerly belonging to the Acadia Sugar Refinery, has been acquired by private enterprise and three berths will be laid down for the building of ships of approximately 10,000 tons displacement. Plans and specifications are already being considered by the government and the keels will soon be laid. The first ship is expected to be ready in fifteen months. The only support the government has given the enterprise is to place a limited number of contracts for steel freighters of the highest class of the tonnage indicated.

Halifax Shipyards, Limited, the Montreal company which, with a capital of \$6,000,000, was granted incorporation last week, is authorized by the Government to engage in a variety of pursuits more or less connected with shipbuilding. The notice of incorporation appearing in the Canada Gazette states that the company may design, construct, pursue, lease or charter steamships, ships, dredges, tugs, scows, steamship lines, transportation lines, wharves, dock yards, shipbuilding yards, marine railways, telegraph and telephone lines, etc., on lands owned or controlled by it. The company may also build and operate steamships, steamboat and railway terminals, transportation warehouse, storage and cold-storage facilities, yards and stockyards, etc., on its own land.

Another Wood Pulp Mill for Quebec

The Great Eastern Paper Company, which is controlled by Chas. W. Mullen, of Bangor, Me., is erecting a ground wood pulp mill near the mouth of the Madeleine River in Northeastern Quebec. The sawmills of the company are already at work and producing lumber on a commercial basis. The limits of the company contain nearly ten million dollars' worth of timber, according to estimates made by expert cruisers. There is a large amount of spruce on the property which is put at 1,479,000,000 feet. Stumpage value of this before the war was \$4,439,700, and now that the government has fixed the price of spruce at from \$35 to \$55 per thousand feet, the value is reported even greater. Ordinarily, about 3 per cent. of spruce is valuable for aeroplane construction, and as the property of the new concern has never been cut over, at least as much of its spruce as the average should be suitable for airplanes, and will bring, it is expected, \$100 per thousand.

Net earnings for the first year of operation with pulp and lumber mills fully under way, are estimated at \$480,000. The fire hazard can be disregarded because that section of the country is subject to fogs which keep the underbrush damp.

A shortage of pulp wood is predicted within the next few months by companies operating in Northern Ontario. The scarcity of help, high wages and transportation difficulties are among the contributing causes. The car service is much improved and several hundred cars a week are now being placed at the disposal of the companies for shipment of the wood to Quebec, Wisconsin and New York points. There are about two hundred and fifty thousand cords to be taken out, the most of which has been lying alongside the tracks of the T. and N. O. and the Transcontinental lines for some months.

Two more electrified mills are being erected on the War Whoop Road, B.C., one being under construction on the James George property by George Kennedy and Charles Booth, and the other by Angus Beaton, formerly of Coghlan, on the McFarland place. With the erection of these two latest industries there will be no less than seven operating in this immediate neighborhood. These mills are the George Leavette mill at the junction of Telegraph Trail; the proposed Charles Tait planing mill at the crossing, the A. Rerrie tie mill, the big mill at Otter, and the tie mill of Frederick M. Singer at Otter Station, as well as the logging camp of the Campbell River Lumber Company, and the Kennedy-Booth and Angus Beaton now just starting up.

EDGINGS

Ontario

Frank Rounds, Welland, Ont., recently lost his lumber warehouse and stock of lumber amounting to \$10,000 by fire. There was some insurance.

The Goderich Mfg. Company, Goderich, Ont., is contemplating the erection of a planing mill to cost \$30,000. All new machinery will be required. The proprietor is Mr. J. E. Baechler.

The planing mill belonging to L. Barrands, Pembroke, Ont., was recently destroyed by fire. The loss on the building and machinery is estimated at about \$13,000, and the insurance is \$10,000.

Good progress is being made on the completion of the new double cut band mill being erected by Cherette and Cherette at Caipha, Ont., on the C. N. R., about twenty-six miles north of Sudbury. The capacity will be about forty thousand feet a day of white pine.

In a serious fire which broke out in the piles of pulp wood of the Ontario Paper Company, at Thorold, Ont., about seven thousand cords of pulp wood were consumed. The loss amounted to over one hundred thousand dollars. The buildings of the company escaped.

A new sawmill is being erected at Bannerman's Siding on the C. P. R., about forty miles west of Sudbury by the Strong Lumber Company. The mill will be a double cut band saw and have an output of about forty thousand feet a day. The principal wood sawn will be white pine.

There is now going direct to the plant of the Port Arthur Pulp and Paper Company, Port Arthur, a spring drive of some 33,000 cords of pulp logs. It is being floated down the north branch of the Current River. The spring drive on the McIntyre River is also well under way and consists of 1,250 cords.

The mill of the White Falls Lumber Company, located at Blind River, on the C. P. R., was recently destroyed by fire. The mill, which was a double cut band one, had been in operation about four years, but had not started up yet for this season. The loss is estimated at twenty-one thousand dollars, partially covered by insurance. The fire took place early in the afternoon and the cause has not been ascertained.

Kitchener, Ont., is the latest municipality to have obtained permission to cut wood for its citizens in Algonquin Park to help out the fuel shortage this year. The other municipalities which have obtained permission are Ottawa, Hamilton, Belleville and Guelph. Randolph McDonald & Company have been granted contract to cut 10,000 cords out of the 25,000 cords which the government is going to cut itself in the park.

At a recent meeting of the York Pioneers Club, Charles W. Nash, who came to Canada many years ago from Sussex, England, stated that one of the reasons of the falling off in the productivity of the soil in York County and in Ontario in general was the too extensive removal of the forest, an opinion in which he is agreed with by many farmers of long practical experience. Not only does this removal of the forest leave the cultivated land too greatly exposed, locally, but where the tree growth is entirely removed from the location of the sources of streams the result is disastrous to a regular and sufficient supply of water through the countryside.

Eastern Canada

M. Michener, St. Ann's, P.Q., lumber dealer, recently suffered loss to his plant by fire.

Official notice is given that the England Lumber Company, St. Mathias-de-Cabano, P.Q., has been dissolved.

The sawmill at Brooklyn, N.S., belonging to Tuttle Taylor, of Port Elgin, N.B., was recently destroyed by fire. The company will likely rebuild.

An incipient forest fire broke out last month back of Chicoutimi, Que., and, although the loss in timber is not heavy, a food cache, belonging to Price Bros. Company was destroyed, causing a loss of \$25,000.

Hon. Jules Allard, Minister of Lands and Forests, has authorized the organization of a fire protective service for the Abitibi region. The service will be under the charge of Inspector Beaudry and ten special guards will be used for the purpose.

Further evidence of satisfactory conditions in the pulp and paper trade was given recently by the dividend announcement of Price Brothers, Limited, placing the rate on a straight eight per cent. dividend basis in place of six per cent., as heretofore.

The contract for building the sulphite mill and power house of the Kipawa Fibre Company, at Temiskaming has been let to the Geo. A. Fuller Co., Ltd., Montreal. Operations have been commenced. The plans of the company include a model town for the employees.

The Gregoire Lumber Corporation, Ltd., have been granted letters patent with head office at Plessisville, P.Q., and capital stock of \$45,000, to carry on a general lumber manufacturing business. Among those interested are N. Gregoire, J. L. Gosselin, J. A. Forand, A. J. Boisvert, L. Houde, all of Plessisville, P.Q.

The Riordon Pulp and Paper Company, Limited, Montreal, has applied to the Minister of Lands & Forests, Province of Quebec, for authority to construct a dam on Gordon Creek at Lumsden's Mills, replacing the existing dam; also for building a conduit, forebay, penstocks and power house at Lake Temiscamingue, bordering upon Gordon Creek and Lake Temiscamingue.

A fire which broke out recently on the Intercolonial Railway between Kedgwick and Anderson, did damage to the extent of fifteen thousand dollars. Some lumber piled near the tracks was destroyed, as well as several hundred cords of pulp wood. F. W. Tapley, of St. John, has been appointed special outside official who will have charge of the guards patrolling the section.

The Canadian Pneumatic Tool Co., Ltd., makers of the Little Giant trucks, Montreal, have appointed Mr. Geo. M. Primm, who is a prominent figure in the automobile trade, as sales manager. The business of the company is growing, and in order to deal more efficiently with the demand for their trucks the company have opened new and handsome showrooms at No. 345 Craig Street West,

Montreal, which also comprise an up-to-date and efficient service station. A complete stock of the various types of Little Giant Trucks is on view at the new premises.

The machine shop at the dockyards and several smaller buildings adjoining were destroyed by fire at Halifax. The building was of fragile construction, and soon fell.

Stocks in Ontario companies of the value of \$7,795 are included in the estate of the late William Stone Mason, a lumber merchant, of Quebec, whose will was filed in the Surrogate Court for ancillary probate. The total value of the estate is \$319,298, of which \$20,000 is bequeathed to Alexandra S. Vary, Quebec, a friend, and the residue to the widow. The liabilities amount to \$150,692.

The Dominion Commission of Conservation is continuing the study begun last year of the conditions on cut-over land in Eastern Canada. The work is under the supervision of Dr. C. D. Howe, of the Faculty of Forestry, University of Toronto. The Laurentide Company and the Riordon Pulp and Paper Company are co-operating and sharing the cost. It is proposed to establish a limited number of sample plots for the more intensive study, throughout a period of years, of the life history of the forest, with a view to determining the specific causes of the changes which take place in its composition, thus gradually establishing a scientific basis for technical forest management.

Western Canada

P. L. Sommerfeld & Co., Ltd., lumber dealers, Saskatoon, Sask., are discontinuing business.

The Canoe River Lumber Company, Limited, has been incorporated with head office at Kamloops, B.C., and capital stock of \$10,000.

The B. C. Mfg. Company, New Westminster, B.C., are contemplating the erection of a sawmill and box factory to cost \$10,000, on Lulu Island. The manager is Mr. J. H. McDonald.

J. J. Grady, Duck Creek, B.C., is contemplating the erection of a sawmill near Sirdar, B.C. Mr. Grady is now negotiating the purchase of mill machinery of 40,000 feet capacity. Site has been chosen.

The Lake Lumber Company, Burnaby Lake, Vancouver, B.C., have plans drawn for the erection of a lumber mill at Qualicum Beach, B.C. The manager is Mr. Johnson. The mill will have a capacity of 40,000 feet per day.

Harold D. Carey, Ltd., has been incorporated with head office at Vancouver, B.C., and capital stock of \$10,000, to carry on business, among other things, of loggers, foresters, timber merchants, lumber manufacturers, etc.

J. J. Grady, Duck Creek, B.C., is contemplating the erection of a sawmill near Sirdar, B.C. Mr. Grady is now negotiating for the purchase of the mill machinery. The capacity of the mill will be 40,000 feet per day.

The B. C. Lumber Co., Ltd., 525 Seymour Street, Vancouver, B.C., have filed plans for erecting wharf and buildings on Graham Island, B.C. (Masset Inlet on Lot 1438 and Lot 2810). The engineer is E. A. Cleveland, 470 Granville Street, Vancouver.

Sealed tenders are being received by the Minister of Lands for British Columbia until July 15, for the purchase of License X727, to cut 7,048,000 feet of fir, cedar, hemlock and pine, on an area situated on Main Lake, Quadra Island, Sayward District. Three years will be allowed for the removal of the timber.

Within two months there will be secured in the province of British Columbia every month sufficient spruce logs for the production of airplanes to meet the maximum demand of the Imperial authorities. By the end of July the difference between log recovery six months ago will be approximately thirty to one.

The firm of Langs & Roddis, of Rosedale, B.C., have purchased by auction from the Crown timber agent's office timber berth No. 571, near Hope. The purchase price was \$4,560, and the berth comprises 552 acres. This firm own other timber in that vicinity and they purpose building a saw and shingle mill to cut the timber.

Statements that the lumber industry is thriving filling large orders for the prairies are premature, according to statements made by managers of various large concerns in Vancouver. Manager Burley, of the B. C. Fir & Cedar Company, said that he had not heard of large orders recently, but if the crop is successful this year big contracts will undoubtedly be made.

Sealed tenders are being received by the Minister of Lands for B. C., until the 5th day of July, 1918, for the purchase of License X1356, to cut 1,924,000 feet of fir, hemlock, and cedar on an area adjoining Lot 901, Loughborough Inlet, R. 1. Coast District. Two years will be allowed for the removal of the timber. Further particulars may be obtained from the Chief Forester, Victoria, B.C.

In a fire which visited the Brunette sawmill at Sapperton, B.C., about \$25,000 damage was done. A storehouse, carpenter shop and wagon shed were destroyed and the mill stables scorched. The heaviest damage occurred to the wharf, which was badly burned in places. The mill crew gave valued aid in fighting the flames. The work of rebuilding the burned buildings is now in progress.

Sealed tenders are being received by the Minister of Lands until the 22nd day of July, 1918, for the purchase of License X1293, to cut 24,394,000 feet of spruce and balsam on an area adjoining S. T. L. 3372P, Dome Creek, South Fork Fraser River, Cariboo District. Five years will be allowed for the removal of the timber. Further particulars may be obtained from the Chief Forester, Victoria, B.C.

Sealed tenders are being received by the Minister of Lands for the Province of B. C., until the 2nd day of July, 1918, for the purchase of License X1305, to cut 3,752,000 feet of spruce, fir and balsam on an area situated near Aleza Lake, Cariboo District. Three years will be allowed for the removal of the timber. Further particulars may be obtained from the Chief Forester, Victoria, B.C.

The Beaver Cove Lumber and Pulp Company, which was recently organized with a capital of one million dollars, and had its headquarters in Vancouver, will erect a pulp plant and sawmill at Beaver Cove, 165 miles north of Vancouver. There will be five units to the pulp plant, the first of which will be proceeded with at once. The company will build a sawmill of 100,000 feet capacity. The timber resources of the organization are said to be about five billion feet. There is a good belt of spruce, some of which is suited for airplane production. A force of men are already at work at Beaver Cove clearing the site and constructing the necessary buildings while the main plant is being placed.

Standard 2 Drum Engine for Skidding or Loading Logs the year round

Moving Logs in Summer

That is the Canadian problem—How to get the logs from the stump to the mill when the snow is off the ground; when the water in the streams is low, or dried up entirely; when the swamps, etc., are impassible; when gullies, ravines, etc., obstruct the passage of men and horses. No wonder lumbering in Canada has been conducted almost exclusively in the winter time in the past.

With Loading and Skidding Machinery

It is now possible to cut logs and ship them to the mill the year round, same as is done in the Southern States, where Jack Frost never comes along to give the lumberman a hand. Our Booklet, "Suggestions for the Lumberman," describes several methods of moving logs the year round—methods suited for the small camp, and methods suited for the large camp; methods for localities where timber is close to the rail or water, and methods for places where timber is farther away.

If you have received your copy of this Booklet, study it well—it will repay you. If you have not received it yet, write us, and you will get it by return mail.

Marsh Engineering Works, Limited Established 1846 **Belleville, Ontario**

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts," then you will buy a "Goodhue." According to the conditions under which the belt has to run, we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality, but each made for a different service.

Dunlop "Gibraltar RedSpecial" Belting

Abnormal Friction Pull

vs. Elasticity of Friction

BETWEEN every ply of specially-selected, heavy Cotton Duck in Dunlop "Gibraltar RedSpecial" Belting is a layer of pure Rubber which, through a Dunlop calendering process, so permeates the fabric that it binds the several plies into one integral piece.

Some belt manufacturers offer to sell their product on the basis of "Heavy-Poundage in a Friction-Pull" Test. To obtain the latter result it is not necessary to secure such an expensive Rubber Friction as is used in "Gibraltar RedSpecial." This fact alone ought to be a pretty good gauge of the value of the "friction-pull" test.

In buying "Gibraltar RedSpecial" you get the advantage of years of careful laboratory work on our part with this result: The friction is of that "just-right" elastic quality which allows for the give and take necessary in rounding the pulleys; hence the reason "Gibraltar RedSpecial" is known for maximum Power, Speed and Service.

Note the Short Grain Rubber Friction

This Belt Section illustrates a Heavy "Poundage-Pull" Friction. To secure this result the Friction Grain is short and stiff. Elasticity and Flexibility have been sacrificed to secure such a result.

Note the Long Grain Rubber Friction

Dunlop "GIBRALTAR REDSPECIAL" has a Friction of Special Dunlop Rubber that retains its life indefinitely "Note the long grain Rubber Friction," as illustrated. Elasticity has not been sacrificed for Abnormal Friction Pull.

UNLIMITED capacity for service is an intrinsic quality with Dunlop "Gibraltar RedSpecial" Belting. The success of nearly a quarter of a century in the manufacture of Rubber Products is built into Gibraltar. The original Made-in-Canada Red Rubber, Frictioned Surface Belting, "Gibraltar RedSpecial" has stood the infallible test of time in turning the wheels of industry in a multitude of Canadian plants from the Atlantic to the Pacific.

The Dunlop Unreserved Guarantee

If you have a difficult drive anywhere in your factory drop a line to our Head Office, or to our nearest branch, and we will send a man experienced in belt engineering to consider your requirements. If it is an instance where the "Gibraltar" Belting may be suitably employed we will recommend its use; and we will stand behind our recommendation with the fullest guarantee ever issued by a firm producing rubber products.

ADJUSTABLE SAFETY CAR-STAKE EQUIPMENT

(SCHMITZ PATENT)

Mr. Logger, Attention !

We have the ONLY device that removes ALL danger and difficulty in moving your logs from camp to mill on cars, trucks or sleighs.

No balks, break-downs or dislocation of parts—IT WORKS ALWAYS. Though still new, it is thoroughly **tried and tested**, and gives perfect satisfaction to all who use it. Nothing like it for speeding up production and reducing expenses.

It will save you TEN times its cost in wages, renewal of stakes, avoidance of accidents, and vexatious delays.

If you don't use stakes on your cars, you CAN use them with this equipment; you need it on your cars right now, and you will WANT it as soon as you find out what it will do for you.

Send for illustrated Circular, with testimonials, and let us convince you of the truth of these claims. Address

*The Babbitt Metal that's at the Front in Efficiency
and Economy*

HARRIS HEAVY PRESSURE

THE ARISTOCRAT OF BABBITT METALS**SHIVES LUMBER CO., LTD., Campbellton, N.B.,
Canada**Messrs. The Canada Metal Co., Ltd.,
Toronto.

Dear Sirs:

Replying to your inquiry regarding our experience with Harris Heavy Pressure Metal, would say we have been using this metal for about five years in main bearings and cranks of Wickes' gangs and steam engines, also edgers, etc., in place of more expensive metals that we formerly used for these bearings.

We are pleased to be able to say that the Harris Heavy Pressure has in every case given us good satisfaction, being a nice metal to pour without shrinking or cracking, and wearing well.

So long as this metal retains its present standard of excellence we will have no hesitation in using it for the most severe conditions we have for babbitt metal.

Yours
JOHN M. MACLEAN,
Superintendent.**WRITE FOR COMPLETE LIST OF BABBITT METALS****THE CANADA METAL COMPANY, Limited****Head Office and Factory TORONTO Fraser Avenue****Branch Factories—****HAMILTON****MONTREAL****WINNIPEG****VANCOUVER**

LINK-BELT

FOR EVERY SERVICE

H-113 Riveted Malleable Iron Link-Belt for Sawdust or Refuse

is an improved No. H-110. May be substituted for No. H-110 without any change in trough or wheels.

MADE IN CANADA

Stronger, Heavier, and More Durable than No. H-110

This is the  Mark of Quality

It appears on every Link-Belt manufactured by us, and is your guarantee of reliability in material, workmanship, inspection and service.

Quebec, Canada - Oct. 30 - 1917

Messrs MacLean Daily Reports,
Toronto, Ont.

Gentlemen:-

Replying to your letter of the 29th inst., re reports we are pleased to say that we find same most satisfactory and more than once they have been the direct means of our obtaining certain business.

We have a great many dealers throughout the country and we forward your reports to our dealers covering their respective towns, and where we have no instance that the dealers actually secured business through them, we do know that they appreciate this service from us very much.

Yours truly,

CHW/A00.

McINTIFF LUMBER CO. LTD.

It Will Pay To Use

The
E. Long
Direct
Acting

STEAM FEEDS

The above illustration gives a good general idea of our direct acting, or shot gun, steam feed, which we build in the following sizes: 8 in., 10 in., 11 in., 12 in. and 14 in. bore, or in any desired size.

The cylinders are made in 6 ft. sections, and are bored to exact diameter. The flanges on cylinders are faced perfectly true, and finished to templates, so that each section is interchangeable. The flanges are also turned on the outside, which is a great convenience for levelling or lining the feed when placing same in mill. For each end of the completed cylinder we furnish short pipes, which are long enough to reach the valves and permit the valve connections and steam feed to nicely clear the floor timbers.

The front cylinder head is our improved pattern.

The piston rod is made from double thickness, seamless steel tubing, of extra large diameter. It is made in two or more sections, according to length of feed.

Our illustrated catalogue contains full details. A copy will be sent you on request.

We have a 10" x 36 ft. Feed in stock for immediate shipment.

"FROST KING" METAL

Our thirty-five years' experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal, made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 35c per lb., Fort William and East; West of Fort William, 40c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 90c per lb.; West of Fort William, \$1.00, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

\$5,000,000.00
worth of mixed metal
sold annually.

D.K. McLAREN'S

Genuine British-Oak Tanned
LEATHER
BELTING

**"The Willing Horse
 Gets the Hardest Work To Do"**

So McLaren's is always put on the difficult runs

There are many reasons why you should use McLaren Belting on your machinery, but take only the question of wearing quality and you will find this genuine oak tanned belting outwear any you have yet used. This remarkable feature has brought the product into prominent use. McLaren's is invariably picked out for the hardest work and difficult runs. Engineers and machinists are unstinted in their praise of McLaren's Belting. "It works better," they say. Test it on your machines; be sure every roll you buy bears the all-important brand of the Oak Leaf. None genuine without it.

We welcome your investigation. Write Head Office and Factory.

CONSERVE YOUR MAN POWER

A Manager: "The Y.M.C.A. in our camp adds one and one-half per cent to the pay roll of the camp. Now, if it does not add three and a half per cent., or five per cent to the efficiency, I am badly mistaken."

A Superintendent: "The men in the camps are very much pleased with the Y. M. C. A. The companies can well afford to furnish a building and Secretary in each camp and to co-operate with the men to maintain the work."

A Camp Cook: "It's a great thing for the woodsmen. If there is anything the matter with the boys the Secretary is the first to aid and he does it without any boast or looking for any graft."

The Y. M. C. A. has solved many labor problems

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year, in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

More Information Desired on Shipping Facilities

In all shipments it is important that cargoes reach their destination as speedily as possible. It has been said that every undertaking costs more in these days than anticipated, and no delivery of goods, whether by freight or express, gets to the consignee on the date expected. There are, of course, many reasons for this, such as the scarcity of labor, shortage of cars, embargoes, permits, licenses, accidents, strikes, and various other things unforeseen. Last winter the railway companies had many perplexities to contend with, and not the least of these were storms of an unusually severe character. Other regulations, such as permits, licenses, embargoes, etc., cropped up generally. Now the way has cleared and stocks are moving with greater facility, while less obstructions of one kind and another exist.

There is a disposition on the part of the traffic managers of the various roads and the lumber interests, to come together, and by conference and discussion clear away seemingly insurmountable barriers. No longer is there any marked shortage of cars, and the thousands of Canadian cars which had been taken over the border have been returned from United States points, so that shipments can be made to American points in U. S. cars, as provided by the regulations. Border points have been cleared, but embargoes still exist at many centres and on numerous lines. By a recent order of the powers at Washington all freight and ticket offices of American lines in Canada have been closed and there are no longer local facilities for ascertaining at what points embargoes exist. Canadian firms do a large business with American customers, and were formerly afforded a mass of valuable information on all shipping points and regulations and in the matter of routing, embargoes, rates, etc. Now they have to scurry around and get this data as best they can. Canadian traffic managers are not aware of all the details, and embargoes are placed on certain lines and at certain points without the knowledge of Canadian shippers. The

result is that many cars are held up for days, and even weeks, at border points, whereas shipments would not have been made if there had been any adequate means of learning beforehand where detention was liable.

It is stated that, like Finnigan's report of a famous accident, these embargoes are "off again, on again, and gone again" before lumbermen in the Dominion doing an export business are made aware of the fact. An embargo may exist on a certain line for a few days then be removed and before the information reaches the local freight administrators it is on again. In the meantime shipments have been made only to be detained in transit. This is annoying all around and results in needless delay. If such intelligence could be furnished promptly, there would be better transportation arrangements, particularly in the East. The Wholesale Lumber Dealers' Association are endeavoring to have the Department of Trade and Commerce at Ottawa use its influence to have a representative of the American roads appointed at Toronto to furnish information about embargoes, etc.

In these days shipments are slow enough under any circumstances, even when all known regulations are complied with, but to send several cars on their destination, where it is expected they will arrive in five or six days, and then to learn that they have not got beyond a certain point, due to embargoes, is, to say the least, exasperating. Some steps should be taken by the United States authorities to provide information of the character already outlined, facilitate distribution and avoid unnecessary delays.

Where Will the Labor Come from for Camps this Fall?

It is a pertinent question just now with woods operators, where are they going to secure men for the camps during the coming season? Time is passing rapidly, and August is drawing very near, when the first contingents will be leaving for the bush. It is all right to adopt a trust-to-luck policy in some things, and to take no thought of the morrow in others, but when the present labor situation is reviewed, a very different attitude may have to be adopted.

The output of timber last season fell off twenty-five to forty per cent. of what was taken out the winter before, and every year since the outbreak of the war there has been a decrease in the quantities of logs reaching the different mills. The help problem was perplexing enough last season, but it will be worse this year, owing to the rigid provisions of the M. S. A., and the thorough combing the country has received for all eligibles for overseas service. The one compensating advantage is that under the new anti-loafing law, every man, no matter what his nationality, must work. This has helped out in some mills, and in one northern centre it is reported that about five hundred rich Austrians and others who had been making good money and carrying it around on their persons were forced to find employment.

In the engagement of help, employment bureaus have always played a most important part. These agencies have been denounced by some companies as unreliable, extortionate, and dishonest. While many firms have employment managers of their own, they have found it necessary, particularly of late years, to use the employment bureaus in order to get sufficient men for the camps. With the employers it has been any port in a storm. The agencies are far from perfect; they will not always stand the test of inspection as to their systems and business methods, and too often they have mere money-making as their end. But until some better plan is devised it looks as if the employment bureau will have to be resorted to by logging concerns.

It has been stated that the Ontario Government intends taking over all the employment business, now that registration has been enforced, and distribute the labor as needed. The provincial authorities have certainly done remarkably fine work in connection with the Organization of Resources Committee and scores of persons, young and old, have been sent to the farms. Whether in a more extended sphere, matters would move as freely and satisfactorily is an item of conjecture. Supposing several companies applied to a government bureau at the same time for an equal number of hands, how would the limited available supply be divided up, or would the companies that came

first be served first and no men be left for the others? One can foresee that all sorts of confusion and misunderstanding might arise were the provincial body to undertake exclusively what is now being done by private enterprises.

There can be no forced regulation of wages the same as there is of food, but there might be some move adopted to prevent certain practices which employment agencies have tried to use in the past. by intimating to a gang when sending them to camp, "well boys, if you do not like it up there why you need not stay. Just come back and we will see what we can do for you somewhere else." Labor of the kind that works in the woods is restless enough without being encouraged and abetted in its uneasy attitude by scheming employment agencies. On the other hand, there seems no quick and available way of getting rough labor except through these mediums. One northern firm, who wanted a few men the other day to peel hemlock bark, sent its man to every town and city in the neighborhood offering the highest wages, and not half a dozen hands were secured. The representative then came to Toronto and made his wants known, and the wages that would be paid. There was not much difficulty in getting all the help that was required.

Another difficulty in the way of abolishing the employment bureau is that the foreigner knows nothing of any other system, and when he strikes a large centre the bureaus are the first places he visits. Time has established this custom and it will take time to eradicate it. The foreigner is always suspicious of the government, after painful experiences in Europe, and naturally thinks that all powers which prevail are alike. Thus he might fight shy of government operated bureaus. There are many sides of the question to be considered, and it is hoped that the best means available will be provided for the good and welfare of the lumber industry as a whole.

Increasing Usefulness of Association to its Members

The measure of worth of any association lies in its usefulness and benefit to the members, both collectively and individually. The activities and the work which it undertakes and successfully carries out are evidences of its stability and alertness. Through the Bureau of Information, which has been established, the Wholesale Lumber Dealers' Association, Incorporated, has done and is doing a splendid work, which is recognized on all sides. It has developed confidence and mutual helpfulness in its varied and systematic methods. There are other branches which are demonstrating the good that can be brought about by unity of interest and co-operation of endeavor.

The latest move on the part of the association in favor of listing of stocks is a distinct advance and can not but help in bettering conditions all around. There are so many kinds of stocks handled by wholesalers, of so many sizes and sorts, and marketing conditions are so diverse, that the Association will be able to prove an outlet. Each man in the lumber business generally develops a specialty along certain lines; he knows the peculiar wants of certain customers, but, like the average merchant handling any class of goods, is prone to get overloaded on some ranges and find himself short on others. Every end of a business must be watched in these days as it costs a great deal to carry certain surplus stocks at the prevailing high rate of interest and insurance. An interchange, on which some members may be long and others short will establish a constant movement, and, to a certain extent, establish market values, or, at least, tend to standardize them.

It is understood that the weekly listing of these stocks will set forth full particulars of what each member of the association has to offer in the way of quantity, grade, point of shipment, price, etc.; what he is in the market for or what he can give in exchange. The way will thus be opened up for a clearing of certain lines. Conditions will be rendered more active and the sundry requirements of customers more promptly and efficiently met. Inquiries are constantly coming into wholesale firms for this and that need and frequently these reach those who have not the stock on hand. Through the medium of the exchange a member will be able to list his wants. It may be that he is loaded up with 1 x 4 good strips of white pine, 1 inch

clear and clear face of red pine, mill culls of spruce, 4/4 birch or 8/4 ash, etc. He has sought to find a market for some of these lines, but in vain, and will, through the new service medium, intimate that he will exchange this material for 2 x 8 good sides of white pine, 2 x 8 mill run red pine, 1 inch log run hemlock 6/4 white oak, log run basswood, mill culls out, etc. In each instance the number of feet, the grade and shipping point will be furnished in the proposed weekly budget of offerings which will be distributed to the members. On receiving the list the probable purchaser or any member desiring to make an exchange will get immediately in touch with the secretary of the association, through whom all negotiations, whether in the way of buying, selling or exchange, will be conducted. No names of firms will be printed on the stock sheets.

By this method stocks will be equalized, distribution widened and diverse needs met. The privilege is one which, when its advantages and possibilities are fully understood, will be appreciated and the service be of direct advantage in many ways. Markets will be found for assorted stocks through the intimate touch and acquaintance which wholesalers have with consumers; retailing and manufacturing outlets provided for material which might otherwise be locked up or held many months before finding a purchaser. The interest in the association will be personally increased and stock lists will afford an index of what surplus exists and in what lines there is a shortage.

Like all other businesses, the lumbering line requires minute attention and careful supervision in order to protect its interests and keep things on the move. There is a customer for practically every kind of lumber if buyer and seller can be brought more closely in touch. Like the articles for sale and articles wanted, which figure in the small ad. columns of the daily press, and bring persons together, so the listing of surplus lumber stocks, either for sale or exchange, through the new trading service provided should pave the way for keeping stagnant lines on the move and equalizing production and distribution.

Augmented Ground Rent of License Holders in Quebec

The Minister of Lands and Forests of the Province of Quebec in a memorandum dated June 12th, recommends the following modification of the Order-in-Council, April 26th, 1910:—1. That the annual ground rent per square mile or fraction of a square mile payable on the issue of licenses to cut timber be of six dollars and fifty cents for the years 1919-20 to 1923-24, both inclusive, and of eight dollars for the years 1924-25 to 1928-29, both inclusive; nevertheless, the rent of ground rent may, at any time, be increased for license-holders who do not operate on their limits, the Crown reserving the right to fix the quantity of timber to be cut to constitute sufficient lumbering operations; 2. That all wood cut in virtue of a license during the lumbering seasons 1918-19 to 1922-23, both inclusive, and 1923-24 to 1927-28, both inclusive, be subject to the following charge:

I.—Square, waney or flat timber, per cubic foot:		
(a) White pine, oak, hickory and walnut	0.08	0.10
(b) Red pine, elm, ash, cedar, basswood, birch, maple, tamarac	0.06	0.08
(c) Spruce, balsam, grey pine or banksian pine, hemlock, white birch, aspen, poplar	0.04	0.06
II.—Saw logs and boom and timber dimension in the raw state, per thousand feet, board measure:		
(a) White pine, oak, hickory, walnut	2.60	3.00
(b) Red pine, elm, ash, basswood, birch, maple, tamarac	2.00	2.00
(c) Spruce, balsam, grey pine or banksian pine, hemlock, white birch, aspen, poplar	1.60	1.80
(d) Cedar	1.40	1.40
III.—Poles more than 18 feet in length, not exceeding 10 inches in diameter at the small end, each:		
(a) 30 feet and less in length	0.25	0.40
(b) 30 feet and less in length	0.50	0.75
(c) 41 to 50 feet in length	1.00	1.50
(d) 51 feet and over in length	2.00	3.00
IV.—Railway ties or sleepers not exceeding 9 feet in length, each		
	0.10	0.10
V.—All other wood goods, ad valorem		
	15%	15%

Wholesale Lumbermen will Open Trading List

The Idea Has Been Successfully Adopted Elsewhere—Members Believe it is Step in Right Direction and Will Prove of Much Benefit

The June meeting of the Wholesale Lumber Dealers' Association, Inc., which was held in the Queen's Hotel, Toronto, on June 14th, was well attended. The chairman, Mr. A. E. Clark, presided.

The most important matter dealt with was a proposal made by Mr. C. W. Wilkinson, of the Union Lumber Company, that, at the conclusion of each of the monthly meetings, the members should have a session of open trading. In making this suggestion Mr. Wilkinson said that it frequently happened that a firm would have stock on hand which it had grown tired of looking at, while at the same time some other firm might know where it could sell this stock, if it could only get hold of it. If the members of the association would arrange for open trading at their meetings, or would devise a plan for listing such stock with the secretary, much of it could be moved.

Plan of Listing Stocks Proposed.

The suggestion met with a sympathetic reception from every member present and led to a spirited discussion which resulted in the passing of a resolution to try the plan of listing stocks with the secretary. The proposal, as outlined in the motion, is that members are to be invited to send to the secretary each week a list of such stocks as they desire to offer through the association, together with the prices they want and information as to the location of the stock. Members are also to be invited to submit lists of stocks which they may wish to purchase through the association. These lists are to be sent in to the secretary as near as possible to the first of the week, so that they may be prepared and sent out to all members of the association by Wednesday of each week.

The idea of association trading is one which has been adopted in a number of cases elsewhere, and has proved successful. Members of the Wholesale Lumber Dealers' Association, discussing the plan after the meeting, were unanimously of the opinion that it was a step in the right direction, and would greatly increase the usefulness of the association to its members.

The membership committee of the association reported that two new members had joined since the last meeting, namely, The Oliver Lumber Company, Toronto, and John H. Eyer, Toronto. Since the meeting another firm, The Canadian Western Lumber Company of Fraser Mills, B.C., who maintain a selling office at Toronto, have also joined, which brings the membership list up to thirty.

Recent Conferences with Railways.

Mr. A. C. Manbert, chairman of the Transportation Committee, reported upon the conferences which had been held with the representatives of the railroad companies and with the Chairman of the Board of Railway Commissioners for Canada, in connection with increased freight rates.

Mr. A. E. Clark, at Mr. Manbert's request, went more fully into this subject. Much of the information in this connection has already appeared in the "Canada Lumberman." The most important feature of Mr. Clark's report was an outline of a conference which he had had with Sir Henry Drayton. Mr. Clark had pointed out to him that the lumber shippers were working under a serious handicap in not having any means of securing information about tariffs filed with the Board other than by searching the files of the Board from time to time. He had urged upon Sir Henry Drayton that the shippers should be advised of tariffs filed, so that they would be able to protest against them, if necessary, before they became effective. Sir Henry Drayton had intimated to him that he would look into this matter, and Mr. Clark had come away with the belief that they could expect the Board to deal with this matter in the near future.

Mr. Clark, and other lumbermen who had had an interview with Sir Henry Drayton, had also discussed thoroughly with him, and subsequently with representatives of the railroad companies at Montreal the application of the increased freight rates recently granted to the United States and the Canadian railroads. As a result of the decision of the United States government to permit an increase of 25 per cent. in freight rates, the situation in connection with the Canadian shippers on an equitable basis with the United States ship by the Association against the Canadian charge of the fifteen per cent. advance on the United States end of a through haul from a Canadian point. The Board of Railway Commissioners had looked with favor upon this protest, but the new 25 per cent. increase in the United States had changed the situation. It was now understood that, as a result to a great extent of the protests made by the Asso-

ciation, Sir Henry Drayton had stated that he intended to place the Canadian shippers on an equitable basis with the United States shippers. This means that from June 25th, when the 25 per cent. increase came into effect in the United States, rates from Canadian points to United States points were placed on the same basis as those between United States points. The increase of the old rates by the Canadian roads, to the extent of fifteen per cent. without any maximum automatically became extinct on June 25th.

How Complicated Tariff Works Out.

Shipments of lumber to the United States from Canadian points, therefore, are now subject to a rather complicated tariff, which is worked out as follows: Take the old rate and increase it by 15 per cent. with a maximum increase of 1 cent per hundred pounds, and add to the result 25 per cent. with a maximum of 5 cents per hundred pounds.

Mr. Clark, in reporting the situation to the meeting, expressed the firm belief that if the association had not protested they would have now had to pay the old rate plus fifteen per cent. without any maximum plus twenty-five per cent.

During the discussion which followed Mr. Clark's report several members stated that they had information that the Canadian railroads intended to make application to the Board for an increase of twenty-five per cent. on Canadian freight rates, to correspond with the increase in the United States.

A discussion then took place on the subject of trade acceptances and on terms of sale, the whole matter being referred to the Committee on terms of sale.

Mr. A. E. Eckardt reported that the Board of Railway Commissioners had issued an order making it compulsory upon the Canadian Railroads to interswitch cars between their lines, the charge not to exceed \$3 per car for distances within and including three miles, and \$3.50 per car for distances over three miles and up to four miles; the order to become effective on July 1st. A protest against this order has been made, however, by the Canadian Manufacturers' Association on the ground that it is so drawn up as to deprive the shipper of the right of routing his cars.

Information Relating to Embargoes.

Mr. D. C. Johnston drew attention to the trouble arising out of the withdrawal of representatives of the United States roads from Canada. When embargoes were placed on United States roads the first they heard about them now was when their cars were held up at the border. If a single representative of all United States roads could be appointed at Toronto to furnish information about embargoes, it would be possible, in many cases, to hold their lumber at the shipping point and avoid detention at the border. A motion was carried that the Transportation Committee should take this matter up and write to the Department of Trade and Commerce at Ottawa, asking them to use their influence to have a man appointed for this purpose.

Mr. E. D. Hardy, manager of the Canadian Lumbermen's Insurance Exchange, Ottawa, who was a guest at the meeting, delivered an interesting address upon the importance to the wholesaler of having the retailers carry sufficient insurance on his stocks.

Short addresses were also delivered by Mr. G. B. VanBlaricom, Editor of "Canada Lumberman," Mr. J. O. Oliver, and Mr. Alex. Gordon, the latter two representing firms which had recently joined the association.

At a meeting of the Directors of the Association which was held in the afternoon, it was decided that there should be no regular monthly meetings during July and August.

N. B. Lumbermen Have Worthy Objects

Writing to the Canada Lumberman, a leading operator in New Brunswick, says: "Our N. B. Lumbermen's Association is not yet completed in its organization. We have had several meetings but as these were at a very busy time, it was difficult to get all those present that we would like and an adjournment was made until August 1.

"The objects outlined are to form an efficiency system of fire protection and to co-operate, fight and extinguish fires on the lands of the members of the association, and to co-operate with the Provincial government in the protection and conservation of Forests, and to make a study of lumber problems and markets."

Mutual Trade Dependency Needed

President of Canadian Lumbermen's Association Speaks on Future Relations of Canada and United States

Closer relationship with our neighbor to the North, which was the subject of an editorial recently printed in these columns, has brought forth some highly interesting letters from among the lumbermen of Canada, says the "New York Lumber Trade Journal," which publishes the following letter from W. Gerard Power, president of the Canadian Lumbermen's Association.

I notice in a recent issue of the New York Lumber Trade Journal extracts from a speech delivered by Mr. Maurice E. Preisch, of North Tonawanda, N.Y.

Whilst it is extremely difficult for me to give any expression of opinion with regard to the sentiment expressed by Mr. Preisch owing to the present greatly disturbed state of the world's affairs, and to the fact that at this time in Canada, the whole energies of the nation being bent on the prosecution of the war, little time has been given to speculation as to what our political future will be. I may say, however, it appears to a great many of us that circumstances will be such that what now may appear to be a dream can very easily become a reality.

As Mr. Preisch stated we are a kindred people, speaking the same language, having the same ideals and aspirations, and the fact that we are now fighting for a common cause, and fighting probably more through motives of pure idealism and a desire to foster the best principles of humanity than any other of the nations who are taking part in the conflict should undoubtedly tend to bring us together more closely.

There is no great annexation sentiment in Canada at the present time, but there is a feeling that never again will our relations be disturbed by such a campaign slogan, "No truck or trade with the Yankees." We need the American business, and you need our great undeveloped resources and raw material, and when the war is over this mutual trade dependency will be felt more and more. Whether it will become more than that it is impossible under the present circumstances to say.

Yours very sincerely,

W. GERARD POWER.

Another Canadian lumberman of international fame whose name is withheld from publication, writing on the subject to the same paper, says:

I was present at the New York dinner, and heard our good friend, Mr. Preisch, introducing Dr. C. W. Colby, and I will say that he did it admirably well. Referring to the sentiment so very nicely expressed by Mr. Preisch as to the future of the United States and Canada, I may say that my life-long view has been that absolute freedom of trade should exist between the two countries. I am aware that at the present time there is a great deal of expression of opinion that even we should go beyond this, and that the two countries should merge into one; on the other hand, there is a feeling on the part of many of preference for our more democratic system of Government, for, while yours is a republic and ours is that of a limited monarchy, strangely enough democracy prevails to a far greater extent in Canada than it does in the United States.

As to the commercial benefit which would accrue to both countries by closer union there is, in my opinion, no question of doubt.

What the outcome will be after this terrible war is over none of us with any degree of certainty can forecast, but there may be changes which are not now seriously thought of, and if this is one of them there will, as I have said, be no doubt as to the commercial benefit, but it will be at the expense of changing our freer institutions for your system, which up to date is not anywhere nearly so advanced in popular government as ours.

Forest Advisory Board Organized

The new Advisory Board, constituted for the purpose of carrying out the Forestry Act in New Brunswick, met recently for organization. This Board will not have anything to do with the administration of the Lands and Mines Department. It is merely an advisory board to deal with forestry branch matters, and to consider what was best to be done with that branch of the service, said Dr. Smith.

While Hon. Dr. Smith, Minister of Lands and Mines, will receive advice from the Board, he will be responsible for carrying out the Act, and will follow his own judgment in carrying out the advice given

him. The Advisory Board is composed of practical men, whose advice should be valuable, said the Minister.

Speaking of game protection, Dr. Smith said that it had been brought to the attention of the Department that moose had been unduly slaughtered in many of the lumber camps throughout the province. It was his intention to have officials appointed as government scalers and game wardens who would remain in some of the larger lumber camps and see that the Game Act as well as the proper lumber conservation regulations were observed at the camps. Two permits were allowed to each camp during the winter season.

Many Tenders to Cut B. C. Fir

Sealed tenders are being received by the Minister of Lands for B. C., until the 11th day of July, 1918, for the purchase of License X1331, to cut 1,164,000 feet of fir and cedar on an area adjoining L. 4435, Sechelt Inlet, New Westminster District. Two years will be allowed for the removal of the timber.

Other sealed tenders under way are—Until the 11th day of July, 1918, for the purchase of License X1331, to cut 1,164,000 feet of fir and cedar on an area adjoining L. 4435, Sechelt Inlet, New Westminster District. Two years will be allowed for the removal of the timber.

Until the 15th day of July, 1918, for the purchase of License X727, to cut 7,048,000 feet of fir, cedar, hemlock and pine on an area situated on Main Lake, Quadra Island, Sayward District. Three years will be allowed for the removal of the timber.

Until the 24th day of August, 1918, for the purchase of License X1369 to cut 5,660,000 feet of fir, cedar, hemlock and spruce on an area situated on Lot 29, Beaver Creek, Loughborough Inlet, Range 1, Coast District. Three years will be allowed for the removal of the timber.

Until the 20th day of July, 1918, for the purchase of License X1363, to cut 2,160,000 feet of fir, cedar and hemlock on an area adjoining L. 448; T. L. 1284P, Valdes Island. Two years will be allowed for the removal of the timber. Further particulars in regard to any of the foregoing may be obtained from the Chief Forester, Victoria, B.C.

Making Newsprint Paper from Sawdust

A portion of the edition of The London (Eng.) Times was printed on paper whereof sawdust is the principal constituent. The Times says: "Sawdust is a by-product produced in Britain. It takes the place of wood pulp, the importation of which is now greatly reduced owing to Government restriction. This paper is manufactured by the Donside Paper Mills, Aberdeen, where experiments have been in progress for a considerable time and are still being carried on in the hope of effecting further improvements."

The annual report of the New South Wales Forestry Commission for the last year refers to the satisfactory inauguration of the scheme for replanting trees in the denuded portions of the State's hardwood forests and the proper protection of timber-producing areas. The estimated area of Crown and private lands in the State containing timber supplies of commercial value is approximately 15,000,000 acres. The total revenue collected during the year amounted to £67,000, a decrease of £838 on the preceding year. This was anticipated owing to the dislocation of the industry due to war conditions. Large quantities of heavy hardwoods, especially suitable for shipbuilding purposes, were shipped to the Pacific coast ports of North America.

Miss Alice Henderson of Gardiner begins her duties this month as fire watcher for the Federal station at Mount Kinoe, Maine. Miss Henderson is the first woman fire watcher appointed in New England, although there are several women watchers in Western preserves. Miss Henderson will live alone in the station, which is two and a half miles from the Mount Kinoe House. If the weather should be particularly dry doubtless another woman watcher will have two and a half miles of telephone wire to look after. In her leisure time the fire watcher expects to knit for the Red Cross.

Even the Oak Must Fall in Time

A correspondent of London, Eng., says Canadian Foresters have felled the famous tree which stood in front of Windsor Castle, known as William the Conqueror's oak. The tree was reputed to be a favorite of the Norman Duke, who protected it from deer. Old manuscripts show the oak tree existed in the year 900. Latterly the tree became unsightly and was very rotten. After ineffectual attempts to have it reinforced with cement, the King ordered its removal.

The timber is very fine grain and color. One slab is used for a mantelpiece in the small replica of a Canadian log cabin built by the Canadians in Windsor Park as a tearoom for the King. A number of souvenirs have been made of the wood. One is a carved plaque of Windsor Castle background and Indian's head.

Active Co-operation with Retailers and Why?

Competition To-day is Between the Service and Ideas of the Dealers and Not on the Lumber that They Carry in Stock—The Things that Are Sold

By H. R. Isherwood, Chicago*

The suggestions which I offer are based upon information and data gathered among retailers and distributors of our product during the past twelve months, during which time I have interviewed and addressed yard operators, manufacturers and wholesalers in many states.

My object was to inform the dealers of the service available to them and at the same time to discuss and offer suggestions in all phases of their business, such as more and better advertising; the use of sales help and arguments in furthering the sale of lumber and the advantages of having more modern offices and equipment.

We have interested many retailers in mill construction and the possibilities of developing the sale of wood for trusses; the importance of their co-operation in building code work and the business of defending the wood shingle as well as giving suggestions for selling in competition with other competitive roof coverings and also the importance to producers as well as distributors that wood preservatives be given more consideration to preserve and insure permanency and protect all concerned.

It is plainly evident that the retailers know very little of this Association, the majority not having the slightest conception of the service available to them through the National and regional associations, and when advised of our service and helps, they are eager for them.

The Idea of Greater Service

It has not been our policy to call upon the retailers with the idea of telling them how to conduct their business, but we have endeavored to make it very plain that my mission, as a representative of our Association, is to convey and outline the service and information available to them, and our desire to obtain from them suggestions and ideas as well as criticisms of how our Association and manufacturers can be of greater service and what helps would be most acceptable.

The publications of the National are highly prized by the retailers, owing to the fact that they permit them to make the recommendations as to the kinds of wood to be used. The value placed upon our publications is clearly indicated by the orders we have received from retailers who are willing to pay stipulated prices. The retailer feels that the general information embodied in our literature, making no reference to species, gives them much more prestige with their customers.

The retailers appreciate the information furnished them by the manufacturer of different species, but do not look with favor upon the manufacturers' efforts to educate the consuming public as to the merits of their woods in advance of the man who distributes the product.

The product that you manufacture in reality is not sold; it is bought by the retailer. You, as manufacturers, are in the same position as the retailer of the past. The stock of lumber carried by the retailer has been bought by the public—not sold by the retailer. Now what the retail lumberman is in need of is educational helps as to the uses of the different woods for purposes for which they are best adapted. Not only should the species be given consideration, but information as to sizes, patterns and grades that are most practical.

You are manufacturing today a large number of different patterns of drop siding, but in no instance have I been able to learn from manufacturers or from their salesmen, why any one particular pattern of drop siding is better for a certain specified purpose, than other patterns. The patterns should be illustrated and their advantages and disadvantages clearly pointed out. These arguments apply not only to drop sidings, but to many other patterns of wood products.

How to Move the Lower Grades

Millions of feet of lumber are being used today for certain purposes of a specified grade where one or two grades lower would insure the same results. The higher grades are being used because of the lack of information on the part of the distributor. If the proper information is conveyed to the retailer through the salesman and circulars, much of the lower grades that accumulate would be in demand today.

The retailers are rapidly developing a progressive spirit of active selling policy by the adoption of service departments

through which they are solving the building problems. This is not only educational on the part of the retailer, but is proving practicable and is of vital importance to us as manufacturers, owing to the fact that the retailer who adopts service ideas becomes the authority upon building information for his community. Specifications as made by him are usually accepted by the builder. This also means that the retailer specifies the materials that will best serve the purpose at the lowest possible cost to the builder, furnishing blue prints and details for the proper construction, which means much in eliminating the fire hazards through improper construction.

The proper construction of homes and other buildings in the larger cities is of vital importance to the manufacturer as well as the retailer. More consideration should be given to interest the retailers in the larger cities to the advantage of furnishing architectural service which will insure satisfactory materials and proper construction. Movements of this kind to encourage the retailers in rendering this kind of service would be of great help to the architectural profession. This help should be furnished by the retailer but should only be to serve that class of people of ordinary means who would not use blue

A log raft of Oregon pine containing 50,000,000 feet on its way from Oregon to Chile. Chilean merchants are making inquiries in regard to British Columbia forest products.

* Paper read before National Lumber Manufacturers' Association, Chicago.

prints, if they were obliged to purchase them outright.

The lumber merchants of Columbus, Ohio, are the first dealers to put in a co-operative Service Department to bring them in closer contact with the owner or the man who pays the bills which will enable them to promote the use of lumber in the construction of homes and other buildings.

What Co-operation Service Does

This permits them to specify kinds of materials that will best serve the purpose and are available from their stock;

Insuring better arranged and designed homes and buildings;

Insuring better construction and reducing fire hazards;

Eliminating contractors' crude pencil drawings;

Eliminating contractors who dictate kinds of material and prices;

Eliminating contractors who insist upon building homes on the retailers' capital;

Eliminating the contractor with bad credit rating;

Assisting the contractor who is doing a legitimate business by eliminating those who are dead beats;

Assisting the local architect by encouraging the use of plans and specifications.

The laboring class of people, or people of ordinary means who are building or purchasing homes on the installment plan are making their purchases largely through contractors and home building organizations, paying too large a profit—getting homes constructed of poor materials and of poor construction which is not only unsatisfactory to them but also to the retailers and the manufacturers, because this cheap construction increases the hazards and is very difficult to overcome.

In many cities I have visited, I found building operations being carried on by contractors and home builders who are selling to this class of people. I have learned of many cases where contractors are building these homes, having started their operations without any capital whatsoever, being financed by the retail lumberman, and today, through the profits they have made upon these transactions, have accumulated funds greater than that of the retail lumberman.

Competition today is between the service and ideas of the retailers and not on the lumber they carry in stock. Modern lumber merchants do not sell lumber, but homes, barns, garages, etc.

Should be Building Material Man

The average lumber merchant not only stocks lumber, but cement, brick, tile, wall board and many other items which enter into the construction of buildings, and, in reality, is a building material merchant.

The independent dealer may have no incentive to push the sale of wood if he can make equal or larger profits on the sale of other building materials. In the nature of things, it rests upon the manufacturer to supply this incentive—by forceful participation in merchandising. This does not necessarily require the ownership of retail establishments, but may be accomplished by co-operation with independent distributing agencies through furnishing expert salesmen, demonstrations of lumber uses, advertising and the manufacture of special products adapted to the requirements of particular sections.

In the past, and in some instances today, much is said in advertising and other ways concerning substitutes. Let it be remembered we cannot hope to create a demand for wood by knocking the so-called substitute, for the latter is principally marketed through the same channels in most cases as our lumber. Let wood be sold on its merits, and, remember, wood has no substitute.

Will Make Forest Yield More Revenue

In these times when governments as well as individuals have to cope with the higher cost of living the province of New Brunswick is looking towards the chief natural resource within its boundaries with the expectation that the forests on the Crown lands of the province will help to swell the revenue. Owing to the lack of vessels to carry the lumber, the timber cut has been smaller in New Brunswick, but the higher rate of stumpage introduced this year has resulted in a substantial increase in the returns to the provincial treasury, and it is now estimated that, with a cut only seventy per cent. of that of last year, the revenue will be \$50,000 greater.

In order to remove the Crown lands from the realm of politics, legislation was adopted at the last session of the Legislature vesting their control in an advisory commission, which would dictate the policy, while leaving the final control to the Minister of Lands and Mines. The commission has been constituted, and held its first session this week. The members are Hon. E. A. Smith, Minister of Lands and Mines; Col. T. G. Loggie, Deputy Minister; C. H. Prince, chief forester; D. J. Buckley, representing the lessees of Crown lands, and Archibald Fraser, representing the owners of granted lands.

The first duty of the new commission is the making of provision for civil service regulations for the employees of the department, whose number will be increased to carry on the more extensive works planned. A committee has been appointed to deal with the matter.

The commission has decided to proceed immediately with the erection of watch towers for the early detection of fires, the cutting of forest trails and the installation of a telephone system. Fire fighting equipment will be purchased and placed at strategic points, and every effort will be made to reduce the waste and loss from fires.

Canadian Veterans Stirring Up Production

In an effort to aid the government to secure the maximum results in timber production and the building of ships, Private Fred W. ("Toby") Boyd and Jack Evans, of the 4th Canadian Mounted Rifles, are now touring the South, says a despatch from Beaumont, Texas, to the "American Lumberman." Private Boyd is travelling for the Southern Pine Association, speaking at the sawmills and logging camps, while Private Evans is addressing the ship yard workers in behalf of the national service section of the United States Shipping Board. With Private Boyd is Claude Simpson Hanby, lyceum lecturer of Rolla, Mo., who also represents the Southern Pine Association.

Both Canadians were members of the same machine gun troop (the suicide squad) of the 4th Mounted Rifles, and both were wounded at Ypres and taken prisoner by the Huns. They described to the ship yard workers and sawmills men here the great hardships they went through and told of their escape from the German lines after five months of hard labor in a German mine with scarcely enough food to keep them alive.

They were two of fifty Canadians who were wounded and taken prisoner at Ypres on June 2, 1916, following a terrible battle in which

The interior of the machine shops of Canadian Forestry Corps at Catford, London.

1,000 of the 1,050 men who comprised the Canadian battalion were killed.

"The lack of ammunition," they declared, "was directly responsible for our defeat," "and this means that you must rush to completion all of the ships you are building in order that ammunition and other supplies may be rushed to the boys 'over there'!"

Private Evans wears a locket ring in which is the miniature photograph of his life-long friend, Billy Flanagan, of Toronto, who was clubbed to death by a German officer for refusing to divulge important information about the allied forces. Both Privates Flanagan and Evans were severely wounded at the time and Private Evans stood helplessly by and witnessed the murder of his friend. He declares he also saw five other wounded Canadians bayoneted to death for refusing to give military secrets to the enemy.

In the opinion of these sturdy young Canadians, Germany can not possibly hold out much longer. They base their opinion on the food situation in Germany.

Brigadier-General McDougall, of Ottawa, director of timber operations, is proceeding to France from London, Eng., in connection with the construction of aeroplanes. The Canadian Forestry Corps has been asked to undertake this work, a considerable amount of which they have already done in England.

A recent despatch from Washington says: Expansion of the wood shipbuilding programme, to include the construction of 200 new vessels of about 4,500 tons displacement each, was announced today by Chairman Hurley, of the Shipping Board. The Board also authorized contracts for 25 large seagoing tugs for use in the coast trade. This will bring the number of tugs now being constructed for the Government up to 100.

Largest Lumber Operation in Nova Scotia

Davison Company Conduct Big Saw Mills, Planing Mill, Box Shook Factory and Sulphite Chipping Mill—Spacious Storage Grounds

Bridgewater is situated eighty miles southwest of Halifax, N.S., and some twelve miles from the mouth of the LaHave River. This town, of some twenty-five hundred inhabitants, is humming with industry. It is on the main line of the Halifax and South Western Railway, and on tidewater for vessels drawing up to twenty feet of water.

Amongst the town's many activities, the largest is the various

The company's double band sawmill at Springfield, N.S.

mills of the Davison Lumber and Manufacturing Company, Limited. The head offices of the company are located here; as is its large water power rotary and gang sawmill, which has a cutting capacity of ninety thousand feet per double shift; its planing mill, box shook factory, and its sulphite chipping mill.

The company owns some two hundred thousand acres of timber lands on which it is conservatively estimated there are about six hundred million feet of the finest Nova Scotia spruce, hemlock, pine and hardwood; and approximately eight hundred thousand cords of pulpwood. In addition to the rotary and gang sawmill mentioned above, the company operates at Springfield, N.S., a double band mill, having a capacity of about one hundred and twenty thousand feet per ten hours. These two mills give the company an annual output of forty million feet per annum of sawn lumber.

At both points, Bridgewater and Springfield, the company has very large storage grounds for the air drying of their lumber; and at all times carries a stock of from fifteen to twenty million feet.

Their specialty is Nova Scotia white spruce, but the quality of all their products is such that amongst the buyers of Nova Scotia woods, in the United States "Davison Quality" has become a standard. The bulk of the production goes to New York and New England markets, but quite large quantities are also exported to Madiera, the West Indies, Cuba and South America.

Until a couple of years ago it was considered an impossibility to ship lumber from Nova Scotia to the United States by rail. In May,

Interior view of the Springfield mill, showing carriage of the single band saw on the left

1916, when the management of the concern underwent a change, Mr. Frank K. Brown, of Clarion, Pa., a lumberman of vast experience, took charge. Up to that time the policy of the company had been to ship all lumber in the rough by vessel. Mr. Brown, however, had different ideas; especially in view of the ever-increasing marine freight rates; and at once installed at Springfield a planing mill with a capacity of about one hundred thousand feet per ten-hour day. This policy proved a huge success as it was bound to do if one will stop to consider the enormous saving in freight effected by the planing and working of the lumber as against marketing it in the rough, apart altogether from the better and easier selling conditions so created. It has been the experience of the company since doing this, that it is more profitable to rail their product than to ship by vessel.

Another point Mr. Brown is bringing home to the industry here is the truth of the old saying: "Take care of the cents; the dollars will take care of themselves." We have too long, far too long, been wasters, and we lumbermen are beginning to learn that some of the "offal" which used to go to the burner is valuable. This is illustrated by the chipping mill which the company have lately erected at Bridgewater, the product of which is most valuable to the paper industry.

Forty Miles of Logging Railway

Another, and most important branch of the industry, is the planing mill and box shook factory at Bridgewater, in connection with which is a large dry kiln. The possession of the planing mill and dry kiln operations places the company in an exceptional position for

Loading a steamer at Bridgewater, N.S., wharf

the cutting, drying and working of special orders. The manufacture of box shook should also prove very successful, as for a goodly portion of their output there is a big demand in the home market. The company is now prepared to beat nature, as they can ship dressed and matched stock, bone dry, within forty-eight hours after the lumber leaves the sawmills.

The firm specialize on kiln dried, end matched and bored hardwood flooring in beech, birch and maple, of A and B grades, that meets any requirements from the finest mansion floor to factory needs.

The logging operations of the company employ some eight to nine hundred men, and to keep their band mill supplied with logs it is necessary to operate a logging railroad about forty miles long, and their four locomotives are kept busy. For the Bridgewater mills the logs are stream driven.

The present active officials of the company are Mr. Frank K. Brown, vice-president and managing director; and Mr. A. F. Pamenter, assistant-secretary and treasurer, who have their offices at Bridgewater, and associated with them are Mr. Robert J. Dodds, president, and Mr. W. H. Seif, secretary and treasurer, with offices at Pittsburg, Pa. The company is represented in the New York market by the Penn Lumber Company, 1736 Grand Central Terminal Building, New York City.

Interswitching on Team Track Work

Railway Commission Sets Forth Order Which Will Facilitate the Handling of Freight

An important order was recently issued by the Board of Railway Commissioners, Ottawa, in regard to the interswitching of freight traffic. The communication was read at the June meeting of the Wholesale Lumber Dealers' Association, Toronto, and owing to its significance to every shipper and receiver of car load freight, it is published in full in the "Canada Lumberman" on the request of the members of the Association.

It appears that the C. P. R. and the G. T. R. have for some years declined to switch cars for the C. N. R. on what is known as team track delivery. This has often resulted in delay and confusion and proved to be a hardship to shippers. Whatever the merits or demerits in regard to the older railway companies refusing to grant interswitching to C. N. R. cars on team track delivery are, it is not necessary to refer to them here. It is the fact the new interswitching order became effective on July 1st that is of importance. It will be observed that the order has been made mandatory in regard to interswitching for team track delivery and that the toll is higher than for delivery on industrial sidings.

Under the authority conferred upon it by the Railway Act, the Board hereby rescinds its Order No. 4988 (General Order No. 11), dated the 8th day of July, 1908, and doth order and declare as follows:—

1. For the interpretation, application and operation of this order—

(a) "Interswitching" means the movement of freight in cars between the unloading or loading tracks of one carrier, hereinafter called the "terminal carrier," and the point of interchange with another carrier, by whom, singly or jointly with a further carrier, the said traffic has been carried from its point of shipment, or is to be carried to its destination, hereinafter called, singly or jointly, the "line carrier," both the terminal carrier and the line carrier which interchanges with the terminal carrier being subject to the jurisdiction of the Board; the said movement being performed with or without the aid of an intermediate carrier, whether subject or not subject to the jurisdiction of the Board, hereinafter called the "intermediary."

(b) The "interchange" means the junction between the terminal carrier and the line carrier, or between the terminal carrier and the intermediary nearest to the point of loading or unloading of the car.

2. This order does not apply—

(a) To tracks used by the terminal carrier for the transfer of freight between cars and its freight warehouse, or for the purpose of trans-shipment from car to car, nor to tracks otherwise set apart for its own working purpose, except team tracks;

(b) To joint movements which both begin and end in the same terminal or group of terminals or adjoining switching districts;

(c) To cars which, having been once properly interswitched for unloading, are reconsigned for unloading elsewhere within the same terminal or group of terminals.

3. Subject to the provisions of section 14, carriers shall at all times, according to their powers, furnish an interswitching service equal to the service accorded their own traffic at all points where interswitching facilities are, or may hereafter be, provided, under the circumstances and at the tolls herein prescribed;

Provided that no terminal carrier or intermediary shall be obliged hereunder to make any movement exceeding the distances herein specified at the tolls herein prescribed, and that the said distances be irrespective of the location of the interchange and of yard limits or boundaries.

4. The toll of an intermediary subject to the jurisdiction of the Board shall not exceed, irrespective of weight, three dollars per car for any distance within and including three miles, or three dollars and fifty cents per car for any distance exceeding three miles to and including four miles.

5. If the traffic is loaded or unloaded upon private sidings connecting with the railway of the terminal carrier, or directly from or into an industry, elevator or yard abutting upon its tracks (commonly known as industrial sidings), or in any public stock yard, the toll of the terminal carrier shall not exceed one cent per 100 lbs. for the actual weight thereof, subject to the minimum weight of the line carrier's tariff, for any distance within and including four miles from the interchange; except that the terminal carrier shall be entitled to a minimum charge of three dollars per carload of traffic included in the 7th, 8th and 10th classes of the Canadian

Freight Classification, and five dollars per carload of all other traffic.

6. The toll of the terminal carrier upon all traffic other than that referred to in section 5, including traffic to or from team tracks, shall not exceed two cents per 100 lbs. for the actual weight thereof, subject to the minimum weight of the line carrier's tariff, for any distance within and including four miles from the interchange; except that the terminal carrier shall be entitled to a minimum charge of six dollars per car.

7. Not less than the following proportions of the tolls herein prescribed shall be absorbed in the rate of the line carrier, and the remainder shall be an addition thereto—

(a) One-half of the tolls charged by the terminal carrier under section 5 as qualified by section 9.

(b) Of the tolls prescribed in section 6, one-half of the tolls permitted under section 5, as qualified by section 9, as if the movement were to or from private sidings.

(c) One-half of the herein prescribed or lower tolls of each intermediary, if any, whether subject or not subject to the jurisdiction of the Board.

Provided that the line carrier may, unless its tariff rate is lower, charge and collect twelve dollars per car for its haul between the interchange and the point of shipment or destination when by reason of such absorption its line charges would otherwise be less than that amount.

8. The appropriate tolls hereinbefore prescribed shall not be exceeded, for the distances herein specified, in each direction, for the movement from and the return to the line carrier of so-called off-line transit traffic, and the line carrier shall be subject to the absorption provisions of section 7 only when its through rates are the sum of its published rates to and from the stop-over point.

9. If an extra car, commonly known as an idler, is used solely to take care of an overhang of long articles loaded on an open car, it shall be charged by the terminal carrier not more than two-thirds of the herein prescribed appropriate toll for the minimum weight of the line carrier's tariff, except that the terminal carrier shall be entitled to a minimum charge of three dollars per car. If interposed between two cars in the same shipment to protect an overhang from each, the idler shall be charged for once only.

10. No charge shall be made for the accessory interswitching of the empty car. If the car is loaded in both directions the interswitching toll shall be charged for each movement.

11. Subject to the provisions of section 14, nothing herein contained shall prevent the line carrier from absorbing the entire toll or tolls charged for interswitching competitive traffic, provided that the traffic and movements so treated are clearly defined in its tariffs.

12. Traffic to or from the United States shall be subject to the provisions of this order at the point of shipment or destination in Canada.

13. If an exceptional rate is published to apply to or from the tracks of the carrier line only, the ordinary rate which includes the right to interswitching shall be plainly indicated in the same schedule, and the latter rate shall not exceed the former by more than the appropriate toll herein prescribed for the interswitching service.

14. Except as hereinafter provided, the tolls herein prescribed shall not apply to deprive the initial carrier of the line haul by a reasonable route of traffic loaded or to be loaded on its railway, including sidings connecting therewith, provided it furnishes at the destination, itself or through its connections or by interswitching, the same delivery and facilities as the competing carrier at no greater charge.

If a car is expressly ordered by the shipper to be interswitched to another railway, notwithstanding that the initial carrier can furnish the services as above provided, the said initial carrier may, in lieu of the tolls otherwise prescribed herein, charge and collect its ordinary published tariff rate to the interchange, which rate shall be an additional charge against the shipment.

Provided, however, that if the said initial carrier fail or neglect to furnish the shipper with a car within forty-eight hours after it has been requested, or should through movement by the route of the initial carrier be embargoed, the shipper may require the initial carrier to accept and place, and the said carrier shall so accept and place, and empty car of any other carrier, in which case the movement of the empty car in and the loaded car out shall be effected under the provisions of sections 10 and 5 or 6, as the case may be.

The schedule to give effect to this order shall be published and filed to come into force on the first day of July, 1918.

Ways That Car Shortage Can be Overcome

How Various Concerns Have Adopted Plans that Materially Relieve the Freight Tie-up and Increase the Carrying Weight of Each Car

The car problem will always be a perplexing one, and as long as goods are shipped there will be delays from one cause or another. The main proposition is to study closely transportation, routing, loading and space economy, and in this way many obstacles and contingencies can be removed. The fault is not all on the one side. No concern possesses a monopoly of all that is good and desirable. It may think that it does, but a little self examination will show any organization that what it often accuses others of neglecting or committing, is done by the original fault finder; perhaps not exactly in the same form, but under a different guise. It may be that the shortcoming is an unconscious one, but in all business regulations among assets which are peculiarly valuable is the ability to see the other fellow's side of the case, and the power to determine when and where responsibility begins and ends. It does not always rest with the other fellow. He is not expected to shoulder all the burden all the while.

There appears, as time goes on, to be more of a disposition for railways and shippers to come together and openly discuss matters, so that a freer and more friendly feeling may be developed, mutual concessions made, misunderstandings and delays explained, and a more sympathetic and intelligent conception of what is required by transportation and shipping interests brought about.

"Ten Ways to Meet the Car Shortage" is a pertinent and timely article from the pen of H. M. Johnson, appearing in July "System," in which he says in part:

Four days before an Ohio box factory had to deliver a rush order for 10,000 boxes, the storeroom containing the lumber was destroyed by fire. The factory superintendent was "up a stump" when it came to getting more material.

He immediately conferred with the purchasing agent, whose consternation was greater than his optimism when he was asked to duplicate the lumber. "It can't be done," he protested, "in less than two weeks. We buy that grade of pine from the Whiting Company in Milwaukee. In these days of slow moving freight, we might as well order it from Australia and expect to get it at any specified date."

Some Pertinent and Helpful Pointers.

"No one else has that grade of pine, you say?" interposed the superintendent. "What about all the lumber firms right in this city? Can't they supply it?"

The purchasing agent thought not. "But it's worth a try," he concluded. On going over his records, he discovered that the salesman from one of these firms had shown him samples of wood pretty much like what they were using, but slightly higher in price. He got the firm on the telephone, found out what they could do for him, and ordered the goods delivered that day. No rail shipment was necessary; three large motor trucks brought the lumber over on one trip.

Now the box factory is buying a large share of its box lumber at home, saving more on freight than the increase it pays on the lumber. Perhaps even more important is the saving in freight car space effected each time the old plan of "carrying coal to Newcastle" is avoided.

Almost every line of business that ships raw materials or finished products, or buys them, has experienced similar difficulties during the past year or two in getting its freight transported. Not all have turned, nor could turn, to home buying as the quickest and easiest way out of the predicament; a number of other ways have been worked out by concerns in a number of lines.

A few of them will illustrate the possibilities for handling freight of almost every description in a more economical way:

- (1) Loading available cars more heavily.
- (2) Packing more compactly.
- (3) Loading together goods of distinct classifications.
- (4) Using cars designed for other commodities.
- (5) Distributing shipping directions to loading and unloading crews, and using extra help to handle incoming freight.
- (6) Using smaller cars so that they can be sent out sooner.
- (7) Marking shipments more distinctly.
- (8) Bailing instead of crating or boxing.
- (9) Hauling by motor truck.

Heavier loading is simple where goods have been shipped in quantities less than the maximum the car will bear. One lumber mill,

for instance, which formerly loaded an average of about 23,000 feet to a car, is now loading over 28,000 feet. It has figured that intensive loading has saved it over 160 whole cars in one year.

A packing house has even doubled the carrying capacity of its cars for some kinds of freight, such as hides, soap, fertilizer, and animal foods. Where it formerly placed only 30,000 pounds in one car, it now loads from 60,000 to 70,000.

When its customers are unable to take the larger quantity—and its sales department is constantly trying to take orders equal to the maximum carload limit—this concern places in one car two consignments for adjacent points of delivery. Although this method requires two separate bills of lading and two terminal handlings of the car, the saving in cars has proved more than worth the trouble.

"In our opinion the average efficiency on cars is a better indication of how the shipper is handling his business than a number of individual instances of delay which may be selected. One manufacturer might be able to show no cars delayed in excess of 48 hours free time, and yet he might be able to show no cars delayed in excess of 48 hours free time and yet he might not be making as good a record as another manufacturer who might have a number of cars delayed considerably longer. For instance, in February, 1917, we had

On the left is H. G. McDermid, secretary-treasurer of the Union Lumber Company, Toronto, and next to him is Geo. Ingram, manager of the Standard Planing Mills, North Bay, while on the right is C. W. Wilkinson managing director of the Union Lumber Company, Toronto. The trio are surveying white pine logs at Trout Mills, Wm. Milne & Son, proprietors, four miles of North Bay on the T. and N. O. line.

14 cars delayed on our industrial tracks five days in excess of free time, while on all cars handled our average detention of cars was only two-thirds of one day. On the other hand, in September, 1917, the worst delays we had were two cars delayed four days beyond free time and two cars delayed three days beyond free time. This might be thought a better record but as a matter of fact the average detention per car of all cars handled was 1½ days."

Another instance: moving tractor shipments on coal cars kept an implement manufacturer from being held up on orders for tractors last winter.

"We load as many as 8 or 10 tractors in 40-foot gondolas," he says. "Our tractor is three-wheeled, and by removing the front wheels and packing the rear wheels up against the side of the car, we could get it in crosswise. Facing alternate tractors in opposite directions gives an extra 15 or 20 inches in car length for every tractor loaded."

One Way to Increase Car Capacity.

Another concern in the same line of business ships its tractors boxed. Placed lengthwise in a small gondola, three tractors fill a car. When they are loaded crosswise, one end resting on the bottom of the car and the other on the side wall, half a dozen boxes will go in. The larger gondolas hold 8 or 10 tractors loaded this way.

"We endeavor to load cars to their full safe carrying capacity," says O. F. Bell, traffic manager of Crane and Company, "and we have managed to increase our average carload from 18 tons to about 30 tons."

"One of our methods is educational. We send bulletins to our

branches and our customers, requesting them to order in quantities sufficient to make maximum carloads, taking into consideration the safe carriage of the goods and their delivery at destination. All shipping and receiving departments and branches are instructed to load and unload cars with the greatest speed and to release cars for other service as soon as they can.

"Our plant was built specially with the design of loading all possible freight in cars at the plant to avoid cartage. Less than carload freight is loaded in cars to an average minimum of about transfer stations of the switching lines, or direct to the carrying roads. We have our own engine and track scale and every desirable facility for prompt handling of freight to and from the cars.

"For the use of our shipping room employees we have a 26-page pamphlet of instructions on packing, marking, and shipping goods by freight and preparing bills of lading. It lists all the goods we make under the heads of the general sales territory, description to be used on bills of lading, the packing required, and the classification rating for less than carload amounts. The use of this set of instructions aids our shipping departments to get cars out rapidly. Our average detention time has been reduced to 1.46 days."

Extra help is drawn from other departments to the receiving rooms of a wholesale grocery whenever a train of freight cars comes in for unloading. Consequently this concern holds cars for hours only where others pay demurrage fees. During the past year this house paid less than \$5 for demurrage, although hundreds of cars come to its platforms every month.

Not every company has employees who can be drawn from their regular work to the freight department, even in emergencies. One importing and exporting firm whose freight house employees are engaged at all times in loading and unloading cars and which therefore has no reserve force to draw on, employs temporary crews of from one to six men when the permanent employees are unable to unload quickly. The extra men help them to get the cars out in one day, whereas otherwise it would take them at least two or three days.

This concern has found it practicable to order a larger proportion of smaller cars than it used to. Where it formerly kept a 50-foot car waiting until a sufficient quantity of goods was on hand to fill it to maximum capacity, it now orders a 36 or a 40-foot car, which can be filled and sent on its way more quickly. The use of "trailers" has also been discontinued. Instead of sending a 15,000-pound load on a second car, the concern holds the shipment until 30,000 or 35,000 pounds have accumulated; then another car is used.

How to Increase Weight in Car.

An increase of 40% in the weight of the average car is the result of a slight change in the shape of the box in which the National Cash Register Company packs one of its products. The new package permits more compact loading by allowing a dove-tailing of boxes where before they had to be placed in tiers.

"We co-operate with other businesses in the regulation of traffic," says the traffic manager, "by permitting the loading of materials—roll paper, for example—destined for other firms in the city, in our carload shipments to fill them to capacity.

"We keep a man making the rounds of all freight depots throughout the day, taking up bills, receipting for freight, and getting it out to the doors so as to keep freight houses clear, and our trucks moving.

"A man also makes the rounds of the express offices each morning and if large shipments arrive or are to be forwarded, they are trucked to or from the express offices; that is, our trucks call for and deliver them.

"We have our own tracks and three switching locomotives with crews. Cars are switched right to the building where our paper stock is located, sand to the regular bins in building convenient, coke to the foundry, steel to the building where it is stored, coal is dumped in the hoppers at the power house, and so on.

"The instructions to the switching crew are that cars must be handled promptly. Our slogan is 'Load and unload cars in hours rather than days.' The results of this are evident from the fact that on 2,500 cars handled last year not one dollar was paid for demurrage."

More as a means of prevention than cure, it is important to mark goods legibly and completely so that they will not be lost; a lost shipment may have to be duplicated, and that takes up a disproportionate amount of car space; the same is true of rerouting or permitting goods to lie in cars unclaimed.

"We stencil all our shipments," says one traffic manager, "and we never have complaints from customers about lost articles.

"It is easy to deface some other kinds of marking. Bold-faced stenciled lettering saves the time of assorters and handlers and avoids needless handling of shipments, because the address is legible at a distance."

The Advantage of Baling Merchandise.

Baling merchandise instead of boxing or crating it condenses the volume and adds one-third to the capacity of a car for some kinds

of materials. A dry goods house which sells at both wholesale and retail bales textiles and such goods as blankets—and even hosiery, although this merchandise is rather hard to manage in the bales.

Where all available freight cars are already assigned for shipments, and a rush order must go at once to a customer within distance reachable by motor truck, one Massachusetts lumber dealer loads the orders on a truck and gets it to the customer's receiving room much sooner than he could by sending it over the rails. One such order was for a load of lumber to be delivered at the New York docks, 225 miles away, with 24 hours. A traffic tie-up made railroad shipment impossible; so the dealer loaded his 11,500 pounds on a motor truck and got the goods to their destination in 22 hours.

Every week a drug concern supplies its branch house—over 100 miles away—with the merchandise it needs, by motor truck. Besides saving freight and car space, the plan has greatly reduced breakage loss. The supplies get to the branch more quickly and with less handling.

Again, a Brooklyn concern, which deals in metal and which at the present time has many government orders to send to Philadelphia, has figured out that it saves an average of 24½ hours on each shipment sent by motor truck instead of by rail.

In arriving at the comparison, the average time of loading the truck at the Brooklyn works, the wait at the terminal at each end, and the unloading time at the Philadelphia terminal were considered. Although this concern finds that shipping by truck costs 35 cents for every 100 pounds, as compared with 30½ cents for the same amount carried by rail, it prefers to pay the difference to know that its orders have been delivered in the shortest possible time.

Budget of Briefs from the East

John Keefe, whose death occurred in St. John, N.B., recently was a member of the International Commission, which was appointed following lumber troubles in the St. John river between the dividing line between New Brunswick and Maine.

F. C. Kinckley of Bangor, Me., a prominent lumber operator, was recently visiting in the province.

George L. Barbour, a well-known resident of St. John, N.B., whose death was reported recently, was a son of Duncan McGregor Barbour, who settled in York County, N.B., and carried on a lumbering and shipbuilding business there.

During the last fortnight there has been heavy rain fall, but there was little or no change in the water of the St. John river. This is undoubtedly due to the dryness of the soil and the log driving operations did not gain much by the rainy spell. A late report from up river was to the effect that the upper drive to the St. John River Log Driving Company is now between Peel and Hartland and the lower drives at Dumfries. The company expects to get the majority, if not all of the logs from the Madawaska Driving Company within a few days.

Rafting operations are now being carried on at Douglas and good progress should be made providing that weather conditions are favorable.

New Set of Rules Will be Drafted

The proposed amendments of the inspection and grading rules and more particularly their application as outlined by the American Hardwood Manufacturers' Association were defeated. It was finally left in the hands of the directors of the two associations—The N. H. L. A. and the A. H. M. A.—to draft a new uniform set of rules which will be satisfactory to both bodies. This is where the question stands at present and the outcome is welcomed by the Canadian members of the National Hardwood Lumber Association.

Among those from the Dominion who attended the annual convention of the National Hardwood Lumber Association held recently in Chicago were:—C. G. Anderson, W. C. Gall, George Hart, A. E. Clark, R. L. Clark, J. A. McBean, W. F. Oliver, J. O. Oliver, Toronto; Frank Kent, Meaford; and H. M. Bernard, Montreal. There were nearly 800 delegates present from every part of America.

It Tells Everything Regarding Oakum

A handsomely illustrated and splendidly bound book entitled "Useful Facts About Oakum and Kindred Products," has been issued by the George Stratford Oakum Company, of Jersey City, N.J., who conduct the largest oakum plant in the world. Much valuable and interesting information is given on oakum and the illustrations are effective and distinct. The plant of the George Stratford Oakum Company has a maximum capacity of 20 tons of oakum per day, occupies about five acres of ground, and has 21 buildings. The history of the firm dates as far back as 1860, and its subsequent development has been progressive and permanent. The company announce that they are the firm who put the O—K into OAKUM.

The Fire Resisting Qualities of Wood

An excellent example of the fire resisting qualities of an ordinary wooden fire wall was furnished in the fire which destroyed the old plants of the Northwestern Box Company and the West Side Lumber & Shingle Company at Portland, Oregon, a few days ago.

This wall was all that stood between the fire and the plant of the Portland Lumber Company, one of the largest and most modern mills in the Northwest. While the flames made a clean sweep of the Northwestern and West Side mills, the Portland Lumber Company's property was not even scorched.

The wall is 35 feet high, constructed of 2 x 6 Douglas fir planks

Fire wall, thirty-five feet high, of Douglas fir planks, which saved plant of large lumber company

laid flat on top of one another, and with buttresses on the side toward the Portland plant, to give stability to the wall. It was constructed about ten years ago. Recently part of it was torn down to make room for a power plant, evidences of which can be seen in pile driver, derrick and steel framing in the foreground.

The fire raged for three or four hours and, on account of the thoroughly seasoned and oily condition of the timbers of the old mill, was of such intensity that it could not be approached within several hundred feet. Despite this, work on the opposite side of the wall continued without interruption.

An examination afterwards revealed that the maximum depth of the charring over the surface of the wall exposed to the fire was less than one inch.

Veteran B.C. Lumberman Visits the East

John D. McCormack, vice-president and general manager of the Canadian Western Lumber Company, Fraser Mills, B.C., spent a few days in Toronto recently, the guest of his son, P. J. McCormack. Mr. McCormack, who is a native of Prince Edward Island, left the insular province some thirty-six years ago, and after spending twenty-five years in lumbering operations in Minnesota proceeded to the Pacific Coast Province, where he has become prominently identified with the development of the industry. He knows the lumbering game from the woods operations to the finished product, and his many friends in the east were glad to meet him.

Touching upon western conditions, Mr. McCormack stated that his firm was employing about 1,500 men in their mills and logging activities. The eight-hour day movement has prevailed along the Coast since March 1st. The Canadian Western Lumber Company, who operate the whole year around, are turning out about 300,000 feet of lumber a day, principally fir and some cedar. It is estimated that during the past few months the labor expense in logging at the Coast has increased about 25 per cent., and that in the sawmills 20 per cent. The hours in both branches are now 55 a week, all plants closing down at 12 o'clock Saturday. Mr. McCormack said that he did not care to discuss conditions likely to arise after the war, nor did he wish to make any predictions regarding what would happen during the period of readjustment. At the present time business was very good and the demand from the prairies steady and promising. While there was a shortage in certain kinds of labor, still there was little complaint to make regarding skilled help. On the whole affairs are regarded by him as satisfactory, although, in his opinion, the price commanded by the finished product has not kept pace with the augmented expense of production.

B. C. Shingle Plants are Busy

Shingle mill manufacturers throughout British Columbia are making strenuous efforts to clean up as far as possible all eastern United States orders before the new freight rates on that side of the line becomes effective, says a recent despatch from Vancouver. Consequently the mills are working to capacity as the most of their business at present comes from the American market. Provision is made that all shingles billed on June 24 will be accepted at the old rate, which will mean a difference of from five to seven or eight cents per hundred pounds. Up to the present, B. C. shingles have always been in eager demand in all of the eastern markets of the United States and Canada and action as regards future orders from the east is eagerly awaited by the manufacturers.

The labor situation in the shingle mill and logging camps is a very serious one, but the producers are making every possible effort to keep pace with the demand.

Personal Paragraphs of Interest

Gardner I. Jones of the Jones Hardwood Co., Boston, Mass., spent a few days in Toronto, recently, on business.

G. E. Farley, who for seven years has been a valued member of the head office staff of the R. Laidlaw Lumber Co., Toronto, has enlisted with the Royal Engineers and gone to St. John's, Que., for training.

Lt.-Col. R. S. Wilson, who has been commanding officer of the Military Hospital Commission, Toronto, for the past year and a half, has resigned. Col. Wilson is the head of the Wilson Lumber Co., Toronto, and previous to going overseas, was prominently connected with the industry.

A. E. Clark, President of the Wholesale Lumber Dealers' Association, Toronto, who is a member of the Inspection Rules Committee of the National Hardwood Lumber Association, which held its twenty-first annual convention in Chicago on June 20 and 21, has been elected a member of the Board of Directors of that body. Mr. Clark will fill out the unexpired portion of the three-year term of the late W. J. Hetherington, Toronto.

Where Bard and Statesman Differ

"What is the difference between Shakespeare and President Wilson of the United States?" asks a well-known Toronto lumberman.

Of course, you give it up, and then, with a twinkle in his eye, the interrogator remarks, "Well, Shakespeare wrote 'Much Ado About Nothing,' while Wilson writes McAdoo about everything."

This sums up the situation correctly so far as Mr. McAdoo is concerned, for he is not only Secretary of the United States Treasury, but Director-General of all the United States railways.

His first action in connection with the conduct of the enormous railway systems in that country was to wipe off the slate every president of every big railway. He abolished competition. Luxurious passenger offices were consolidated into comfortable work-a-day agencies, old barnacle employees were dismissed, and big salaries cut 60 per cent.

Sitka Spruce Finest in the World

Referring to the statement of Mr. Johnson Hicks, chairman of the British Parliamentary Air Committee, that England was preparing to launch into a tremendous campaign of airship building and fighting, the Imperial Munitions Board, Ottawa, stated that Canada's organization for the production of airplane timber was complete except in one particular.

"The production of airplanes depends as much upon the supply of suitable timber as upon any other one thing," said an officer of the board. "The best timber so far discovered for airplane construction is Sitka spruce, which grows exclusively on the Pacific coast, and then only in favored localities. Washington and Oregon states have a fair area of this timber, but Queen Charlotte Island and the deeply indented bays and inlets of the mainland and Vancouver Island, on the British Columbia coast, have the greatest areas in the world, the trees in some districts averaging eight feet in diameter and running as high as twelve feet.

Employees Honored Patriotic Day

Flag Day was enthusiastically celebrated June 14th by the employees of G. E. Elias & Bro., 965 Elk St., Buffalo, N.Y. More than three hundred were present when the exercises were opened by Mr. A. J. Elias, who spoke briefly of the work done by the employees during the Liberty Loan and Red Cross drives. Mr. Henry G. Price then gave an instructive address, dealing with the history of the American flag. A splendid band was engaged for the occasion by the firm and the even closed by the employees singing "The Star Spangled Banner."

New Officers of Quebec Limit Holders

The fifteenth annual meeting of "The Province of Quebec Limit Holders' Association" was held at The Windsor hotel, Montreal, Thursday, June 13.

There was a good attendance, Ed. Ouellette, M.L.A., President, being in the chair. The President's annual report and financial statement were read and approved.

Discussions took place on reforestation and the ravages caused by tree destroying insects, and resolutions were adopted nominating special committees to examine into these.

The election of officers resulted in the following being elected:

President—D. McLachlin.

Vice-Presidents—A. J. Price and M. C. Small.

Executive Committee—F. M. Anderson, H. Biermans, Arch. Fraser, Wm. Russell, B. A. Scott, S. L. de Carteret, Geo. Cahoon, Jr., W. G. Power, F. I. Ritchie, G. M. Stearns; ex-Presidents, (who are members of the Executive Committee)—Wm. Power, Rod. Tourville, M. L. A., Ed. Ouellette, M. L. A.

Auditor—P. B. Murphy.

Secretary-Treasurer—P. G. Owen.

Attorneys—Pentland, Gravel & Thomson.

The meeting adopted by a standing vote a resolution expressing the great loss to this Association by the death of Gustavus G. Stuart, K.C., who had been Counsel for the Association since its organization.

Newsy Notes from Canada's Capital

The erection of a million dollar nickel and refining plant, owned by the British American nickel corporation at Deschambault, Que., will likely result in keen competition among Ottawa lumber merchants for boarding for the concrete forms, and interior wood work finishings. The plant, which is to be erected entirely of concrete, is under construction, and will be in operation before the winter months. Definite amounts of materials and specifications of the big plant have not been made public. James Davidson's Sons appear to be in line to quote successfully for a good part of the lumbering work, as their lumber in transit from Fort Colongue comes down the north shore of the Ottawa River, close to the site where the building operations are going on. Both British and Norwegian interests are reported to be back of the scheme.

According to opinions expressed by a leading real estate man at Ottawa recently the Dominion Government will soon have to step in and assume the responsibility for housing employees doing war work and important government work at Ottawa.

A report on the operations of the Canadian Forestry Corps reaching the Militia department at Ottawa, states that one Company made a record production for sawn lumber. In ten hours' sawing the company turned out 156,000 feet board measure, or 372 tons. of one, two and three inch butted lumber. In the course of their operations the workmen sawed 342 logs.

Grant Davidson of James Davidson's Sons, who was recently confined to hospital through an injury received in the woodworking plant, has returned to work.

Urgent Need for Lower Priced Houses

The pressing need of housing accommodation in the city of Toronto is dealt with by the Medical Health Officer (Dr. Hastings) in his annual report, which was presented to the Board of Health recently as one of the most serious problems to be dealt with. Such condition, the report points out, was to be expected with the increase of the population of Toronto, which has caused a doubling of families in many of the old buildings, that ought to be pulled down and replaced by proper habitations.

The lack of accommodation now felt will be augmented in the very near future, when the war ends and peace is declared," states Dr. Hastings. "We shall probably, within the next five years, have another 150,000 added to our population. That means some 30,000 families, taking the average of five to each family, to be provided with dwellings. This will necessitate at the very lowest calculation 25,000 additional dwellings within the next five years, if a recurrence of the congested and unsanitary conditions which existed a few years ago is to be prevented. We should have an average of 5,000 of these lower renting houses erected every year, and there is no evidence of this provision being forthcoming. The records of the city architect for the year 1917 show the number of dwellings erected was only 902, at an average cost of \$2,500 to \$3,000 each."

The report states that there are over 5,000 families now in Toronto requiring sanitary dwellings that cannot be had owing to the shortage. Land values and the increased cost of material and labor have made the building of low renting houses prohibitive so far as the speculative builder is concerned. The unskilled laborer cannot

afford to pay the rent demanded for a \$3,000 house, and the few \$2,000 houses erected have been rapidly taken up.

Motor Cycle Patrol Proves Successful

The work of the St. Maurice Forest Protective Association, Limited, with headquarters at Three Rivers, P.Q., continues to produce good results. During May there were 35 fires, practically all of a small character. The settlers, says Mr. Henry Sorgius, the secretary and manager, are realizing the beneficial nature of the work, and are co-operating more freely with the officers of the association. In conjunction with the clergy, the Canadian Forestry Association, and the Quebec Government, the association has held meetings at different points at which talks on the value of forest protection have been given, and lantern slides shown, with a view of impressing on the settlers the importance of preserving the standing timber. The meetings were very largely attended—in one instance 300 were present. "It would

Motor cycle and horse patrol in St. Maurice Forest Protective Association

be a good idea," said Mr. Sorgius, to extend this work to the lumber camps."

The Association has added to its equipment. The motor cycle patrol has proved of very great service, as the machine can go faster than the horse, and can get to places where an automobile cannot penetrate.

Mr. Ellwood Wilson, chief forester of Laurentide, Ltd., Grand-Mere, P.Q., has been appointed to the staff of the Imperial Munitions Board, and is now purchasing spruce for aeroplanes.

Mr. G. C. Piche, chief of the forest service of the Province of Quebec, has also taken over the duties of superintendent of forest protection, including that of fire prevention.

Pacific Coast Men Fear Car Shortage

Western lumbermen are viewing the progress of events just at this time with considerable concern, especially in their relation to transportation, says a late despatch. A recent decision of the United States fuel controller to place a limit on shipments of anthracite coal and the decision of the fuel controller of Canada, following a lengthy conference with coal men from all over this country, to limit shipments of anthracite to Winnipeg as the farthest western point, has an influence on the lumber trade of British Columbia. The great wheat crop which the prairies promise this season will reflect detrimentally on the lumber trade also. The wheat outlook and the coal outlook will both work against this year's lumber output of British Columbia mills.

R. H. H. Alexander, secretary of the B. C. Lumber and Shingle Association, recently drew attention to the fact that there is strong probability of a serious car shortage for the carrying of lumber, and will be caused by the extraordinary demands on the railway companies for cars for wheat and coal. The wheat crop would not have given unusual concern but, combined with the new coal regulations, it will mean that a shortage of cars must follow and become a serious drawback to the progress of the lumber industry.

Kenneth Gilson, of Corry, Penna., who returned lately from Spitzbergen, Norway, where he was general manager of a coal company, said they had no oats to feed the mules at the mines on account of the war. Just when it was a question whether the mules should be killed instead of being allowed to starve to death, a steamship arrived with a cargo of "paper oats," a feed substitute from Germany. "We bought two tons," he continued, "and expected that the mules would refuse to eat the stuff, but the animals took a liking to the new die and actually thrived on it."

Is Cafeteria System Practical in Logging?

There was presented in a recent issue of the Canada Lumberman a comprehensive and illustrated article of the cafeteria plan of feeding men in mining camps as practised by the Kerr Lake Mining Co. at Cobalt. This organization is delighted with the economy, convenience and cleanliness of the service.

"How would the system work out in the ordinary logging camp?" is a pertinent question, and in view of the new rationing regulations about to go into effect in all camps is particularly appropos at the present uncture. The opinion of several large-woods operators has been obtained. They nearly all declare that the method employed by the Kerr Lake Co. is not feasible or desirable in lumbering activities, owing to the shifting character of the operation, the different classes of labor employed, etc.

W. Gerard Power, St. Pacome, Que., president of the Canadian Lumbermen's Association, says that as far as the province of Quebec is concerned, the cafeteria system could not be adopted.

"You are probably aware," he adds, "that all logging in this Province is done by small contractors, and very few camps have over 25 men, and a lot of the cooking is done by the contractor's own family, and in some cases his wife or daughter does the work. I even doubt if this plan would be feasible where companies are operating their own camps in this province, as the class of labor used in logging camps is quite different to class of labor used in mining."

"At the present stage of the game with the great shortage of labor, we will simply have to do the best we can to keep our help and also try and devise some plan to save food. This will have to be worked out when the men go back to the woods again, if any men are available for next winter's logging."

Process of Education and Co-operation.

George H. Holt of the Holt Timber Co., Chicago, who carry on extensive operations in both Canada and the United States, asserts: The account of the cafeteria system at the Kerr Lake Mining Co. plant is a valuable contribution to the study of food conservation, but it is perfectly apparent that it cannot be accepted bodily as a standard for a great number of detached and temporary lumber camps. The principle may be set down now as approved by many lumbermen, but the "modus operandi," the details of method, equipment, utensils, proportions and qualities of materials, and the rotation of bills of fare, the training of the staff of cooks and assistants, and competent overseers who shall supervise and coordinate the actual operation of the system so that standardization and conservation may actually be effected, and the collapse of the system and the defeat of its purpose prevented, the questions of penalties for infraction of regulations, or rewards for efficiency, the fixing of responsibility and authority in some organization or department, with its personnel of help-giving and trained executives, accountants, price and quantity regulators, laboratory workers, production and distribution employes,—these and many other practical details of getting down out of dreamland and walking every day on the unstable earth must have first consideration and fixation before this machine for food conservation is ready to run.

Who should act first? If there is one thing that a practical lumberman knows less about than another my guess is that it is a successful modern cafeteria.

We have a damaging rudimentary experience in this self-serving or picnic scheme long characteristic of the log drive and the voyageur. The chief characteristics of the drive feeding are wastefulness, discomfort, and short-lived tolerance. It is no model for an efficient cafeteria, but some men talk as though they were the same thing. Of course such men must denounce the cafeteria as impracticable. Other men visualize the fanciful, showy, advertising features of the city cafeteria, and of course they also denounce the cafeteria.

Why should we take the slow, uncertain, costly course of working out a new system individualistically, and blunder along for years? The problem is national, or if you like, international, and the effective way is for the government to be prepared at the time that it puts its new regulations into effect, to issue a pamphlet of instructions and

requirements, and tables of materials and utensils, standardized to units of 10 or 100 men, and directions to employers, superintendents, cooks and clerks to guide them at the start and along the way, so that there may be no lost motion and no regrets and no failures.

How can this be accomplished? First, by commandeering a group of the best cafeteria men and placing the problem of a practical system before them for solution. If the lumbermen know little about running a cafeteria, I have a sneaking notion that the cafeteria men know less about a lumber camp, therefore practical lumbermen should be brigaded with practical cafeteria men, at least that much to begin with. Anything short of that is to muddle.

The cafeteria system is certainly a practicable model which can be developed into a food-and-labor-saving system for lumber camps, and all similar aggregations. Methods of cooking and serving and taking care of and utilizing materials can be made to greatly reduce costs at the same time that the crew is being better fed than now.

Lumbermen have not been students of feeding-for-profit; they have been chiefly concerned with hustling log and lumber quantity production. Feeding has been an unavoidable and hateful incident in that major process. Now that we face the problems of international defeat and starvation, feeding has become the major and lumbering the minor problem. If we write that large and see it larger, we can manage successfully."

Let All Unite in Food Reforms.

A representative of the Schroeder Mills and Timber Co., Pakesley, Ont., declares:

Well, Sir: "I am from Missouri." The writer of that article does not show that he has saved anything; in fact, using his own words, he says: "It has been found by experiments that less bread, butter, tea, coffee and milk were used when all of these were placed on the table where men can help themselves."

"Now why is it not the same with meats? I venture to say that if they look closer they will find different reasons to account for the saving of meat, if there is any."

In my opinion the proper way to save meat would be to have meatless meals. For instance, allow us to use no meat for breakfast; then if we find that there is as much used for dinner and supper as we now use in the three meals, then have it served; but it must be law. There is no use of one man starting out alone to make these reforms. In regards to flour, we could stand a much lower grade of war flour than we have to-day. In fact, the war flour that we are using makes just as white bread as the flour we used before the war! commodity was thought of.

"As for sugar and lard these can be regulated very easily. Sugar can be eliminated from table use and lard can be regulated to so many pounds to the bag of flour."

"Is it not a fact that the people of the United States, at the request of the Food Controller, saved so much meat that the packers began to complain, and Mr. Hoover had to ask the people to resume the normal consumption of it to keep it from spoiling? Sometimes I wonder if the packers did not see a slump in prices in sight, but, of course, our packers are different. They would not use their influence with the government to further their ends at the expense of the country."

Views Expressed in Short Shape.

W. B. Snowball, president of the J. B. Snowball Co., Chatham, N.B., says: "I read the article in the June number, re Cafeteria. I do not think, however, it could be applied to the lumber camps in this section, although a great deal could be done to conserve food in all our camps."

Melville Bertram, president of the Collins Inlet Lumber Co., Toronto, declares: "We are confident that the cafeteria plan would not work with us for a good many reasons which we do not care to discuss at the present time."

W. J. Bell of the Spanish River Mills, Sudbury, stated that the cafeteria plan would not work out satisfactorily in the lumber camps which are shifted too frequently, while the help employed is generally of a totally different class to that engaged in mining operations which are more fixed and stable in character.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch), \$2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Trimmer Ends Wanted

White Pine, Red Pine and Spruce, 1917 or 1918 cut. Write stating approximately what you have. Give thickness, conditions as to color, worms, etc. Box 738, Canada Lumberman, Toronto, Ont. 10-15

For Sale-Lumber

Piling

We are operating in the woods this Summer and can supply piling any size and length. Enquiries solicited.

Knight Bros. & McKinnon, Limited, Box 569, Cobalt, Ont. 10-13

WANTED to buy logging equipment for operation on Canadian Pacific Railway. Box 756. 13-14

For Sale-Lumber

Would like to hear from U. S. or Canadian parties requiring Spruce and Balsam or Peeled Poplar Pulpwood with best quotations F.O.B. Kenogami Lake Siding, New Ontario, T. & N. O.

W. J. POST, Kenogami Lake P.O., Ont. 13-14

Lumber For Sale

Two cars 4 x 4 Maple Boxed Hearts.
One car 5 x 5 Maple Boxed Hearts.
One car 6 x 6 Maple Boxed Hearts.
Seven cars Fir Doors.
Three cars Fir Columns.

GEO. C. GOODFELLOW, Montreal, Que. c

For Sale-Machinery

For Sale

Steam Log Hauler, only used one season, in best of order.
Eighteen pairs of sleds, spare parts. Also yarding, and loading equipment. Now at a railway station.

MURRAY & GREGORY, LTD., St. John, N.B. 11-t.f.

For Sale

McGregor & Gourlay Double Surfer, 26 in. \$350.00 cash.

Canada Lumber Company, Ltd., 13-13 Weston, Ont.

FOR SALE -40 horse power steam engine, heater and duplex steam pump. All in good condition. Will consider any reasonable offer.

-JAMES PEARS, SR., 200 Eglinton Ave. West, Toronto, Ont. 13-13

Machinery For Sale

One 40-inch Crocker Turbine Water Wheel.
One 18-inch Little Giant Water Wheel.
One 75 h.p. Corliss Engine.
One Waterous Lath Machine.
One Clapboard Machine.

VALLEY LUMBER CO., Smith's Mills, Que. 11-14

Boilers For Sale

Four Boilers in A1 condition, 12 ft. x 4 1/2 ft. with 50 3/4-inch Tubes, Double Rivetted Butt Straps, Dome and Safety Pop Valves, 115 lbs. Government Steam Test.

HOPE LUMBER CO., Thessalon, Ont. 11-14

Machinery For Sale

Boiler for sale, Goldie & McCulloch, 60 in. x 14 ft.

GUELPH LUMBER COMPANY, Guelph, Ont. 11-15

Steam Equipment For Sale

Steam Power Equipment in A1 condition, consisting of the following:

BOILER
1-Horizontal Fire Tube, Goldie & McCulloch 60 in. x 14 ft., 74 3-in. flues, 100 lbs. normal pressure.

ENGINE
1-Goldie & McCulloch "Ideal" tandem compound horizontal, style T.C. 10 in. and 16 in. x 12 in. stroke, 100 lbs. pressure, 300 r.p.m., 60 in. x 10 in. flyball governor wheel and 60 in x 12 in. belt pulley.

ADDITIONAL EQUIPMENT
1-Belt-driven Goldie & McCulloch Condenser and Pump; Horizontal Action.

1-Horizontal Feedwater Heater, Goldie & McCulloch No. 18.

1-Vertical Belt-driven Feed Pump, with loose pulley and adjustable crank.

All of the above equipment is in first class shape and was removed to make room for a sub-station of the Hydro-electric Power Commission. For further information address,

The Smith's Falls Hydro-Electric System, 11-14 Smith's Falls, Ont.

Wanted-Machinery

WANTED-Second-hand burner, suitable for mill of 35,000 feet capacity. Address Pierce-Jacobs Lumber Co., Timmins, Ont. 13-13

Wanted

Second-hand Chain, 3/8 in., 1 in., 1 1/4 in., 1 1/2 in., boom shackles for same, wire rope, same sizes, black pipe, 2 to 5 in. State lengths. Will pay cash.

D. G. RHEAULT, Mont Joli, Que. 13-13

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

EXPERIENCED LUMBERMAN, married, wants position as manager. Still employed. Superintended lumber cut, estimate and shipment. Reason for change, company not doing further business. Reference given. Box 662, Canada Lumberman, Toronto, Ont. 11-13

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED SUPERINTENDENT FOR WOODWORKING PLANT, specializing on interior trim, Bank, Office and Store Fixtures, as well as general building trade. Must be able to read plans and details, make accurate estimates and be able to make sketches and drawings. Apply, giving references and salary expected. Also want saw filer, and Machine men for sticker and shaper. The S. Hadley Lumber Co., Ltd., Chatham, Ont., Canada. 12-13

Business Chances

PARLIAMENT BUILDINGS, OTTAWA

Tenders Wanted for Interior Doors, etc.

Sealed tenders will be received by the undersigned until noon, July 16, 1918, for the "Interior Doors, etc." required in the reconstruction of this building.

All tenders are to be based on the supplying and delivering to the site in the manner indicated and under the conditions set forth of all doors, door frames, transom sash, door trim, base-board, picture mould, etc., as indicated and described on the drawings and in the specifications.

The work of this contract shall be proceeded with as may be directed and in such a manner as to comply with the requirements of the specifications.

Plans, specifications and any other information required can be obtained at the office of the General Contractors, P. Lyall & Sons Construction Company, Limited, Ottawa.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Minister of Public Works for a sum not less than five per cent. (5%) of the amount of the tender, which will be forfeited if the parties tendering decline to enter into a contract when called upon to do so. If the Tender is not accepted the cheque will be returned. If the tender is accepted an additional cheque for a sum equivalent to five per cent. (5%) of the tender must be deposited before the contract is signed. The total security will be forfeited if the contractor fails to complete the work contracted for.

Payments for material will be made monthly. Samples must be submitted as required by the specifications.

The lowest or any tender not necessarily accepted.

Envelopes containing tenders to be marked, "Tenders for Interior Doors, etc." and addressed to the undersigned.

JOHN A. PEARSON, Architect.
J. O. MARCHAND, Associate.
Centre Block, Parliament Bldg., Ottawa. 13-13

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood. New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON, P. O. Box 2624, Montreal, Que. 8-t.f.

For Sale

260 miles of Timber Limits, St. John River, County Saguenay, North Shore, P.Q. For particulars address

D. BREAKEY, 13-14 Breakeyville, County Levis, P.Q.

Planing Mill and Lumber Yard FOR SALE

Well established and everything in good condition. Will be sold at a bargain, as owners have other business that demands their strict attention. The lumber can be bought at right prices, of which there is a large stock. We ask personal investigation.

13-13 LAIRD BROS., Dresden, Ont.

The New Forestry System in New Brunswick

In connection with the new Forestry System which will prevail in New Brunswick the administration of the Forest and Forest Fires Acts will be under the Minister of Lands and Mines. A provincial forester will be in charge of the administration of scaling, enforcement of cutting regulations on Crown lands, continuation of the forest survey, forest fire protection, and the enforcement of the laws and regulations concerning fish and game.

The merit system of appointments will be strongly promoted through the appointment of a Forestry Advisory Commission, consisting of the Minister and Deputy Minister of Lands and Mines, the Provincial Forester, one prominent lumberman selected by and representing the licensees of Crown timber lands, and one other lumberman or forester associated with the ownership or management of Crown-granted forest lands. This Commission will supervise appointments, which are to be based upon a practical examination, written and oral, designed to test the knowledge and ability of the applicants to perform the duties of the office which they seek.

The provisions relative to forest fire protection are based upon the most advanced legislation in the several provinces and states. The organization will cover Crown timber lands.

U. S. Government Fixes Douglas Fir Price.

Prices on Douglas Fir lumber, both for government use and for the trade, have been established, by the Price Fixing Committee of the War Industries Board at approximately \$26 per 1000 feet, in car-load lots, according to advice received by the lumber manufacturers from Washington, D. C.

This price is a net advance of approximately 75 cents per 1000 over the present government prices, and is based on the comprehensive cost data covering a group of more than 30 typical Fir producing mills in Western Oregon and Washington.

The slight advance authorized by the Price Fixing Committee will only partially cover the additional costs of operation due to the adoption of the eight-hour day, the higher prices of material, increases in freight rates and all other increased expenses that are being experienced in the lumber industry the same as in other industries. Up until this time the government never has made an allowance to the mills for the extra costs growing out of the eight-hour day, which was established by the mills on March 1st.

While the new price schedule nominally provides for an increase of \$1.75 per 1000 feet, the government advanced the log prices so that the mills automatically are required to pay \$1 per 1000 feet more for their logs than under the old schedule, leaving them the narrow margin of 75 cents per 1000 to absorb all their other expenses.

In a letter to the press on the Maritime Provinces, John G. Kay, of Fredericton, N.B., takes strong exception to so much pulpwood being cut at the present time and adds: "Men are engaged in peeling pulpwood who might be better employed at some real useful work. I am informed that many thousands of cords of pulpwood are piled along the railways in this province awaiting shipment, and because of the shortage of cars cannot and will not be moved until after the war."

"Now there are a great many men engaged in peeling pulpwood who call themselves farmers. They are doing a needless work and could be much better employed in France. The price of pulp was never so high as now and if the waste is kept up, what will timber be worth twenty years from now? If we had prevented the extract mills from destroying our hemlock years ago, we would now have untold wealth in hemlock."

"I am sure the piling up of pulpwood along the railway tracks in this country is going to bring bad results in the future. The country is being haggled over by thoughtless people who will live to see the day when they will curse the pulp business."

"I believe there is greater need of a pulp controller than there is of a food controller. It takes forty years to raise a crop of pulpwood while a crop of food can be raised every year."

"I will go further and say that if the same amount of labor that is now used in getting out pulpwood was used in providing food, we would have a better country."

William Rutherford, of William Rutherford Sons Company, Limited, Montreal, is active in the work of the Navy League of Canada. Arrangements have been made for a strenuous campaign in the province of Quebec with a view to create a wider feeling of interest in the creation of a strong mercantile fleet manned by Canadians, and already many applications for membership have been received. A membership of 25,000 for the province is aimed at, and to this end a thorough canvass of the province is to be made. Extensive publicity has been given to the objects of the League, it being pointed out that the people of the province are vitally interested in Canada becoming a great maritime power, as in addition to having the best connections between rail and sea, the product of forests and farms must be insured against the lack of transportation that now constitutes a most serious problem. It is further pointed out that a race of natural born sailors are bred along the shores of the St. Lawrence.

In Montreal the general chairman in charge of the membership is Mr. J. H. Sherard, of the Parkhill Manufacturing Co., Mr. William Rutherford being chairman of the manufacturers' committee.

Review of Current Trade Conditions

Ontario.

General market conditions remain much the same as they have during the past few weeks. In a few lines there is a seasonable quietness, while in others there is marked activity. Values are well maintained and there is no tendency in the direction of reduced quotations. Wholesalers who have been hanging aloof in the matter of buying stocks, fearing to assume the risk and believing that prices would drop have come to the conclusion that the market after all, is a sellers' one, and there is now considerable competition. It is reported that several million feet of white pine were sold recently at an Ontario point at \$43, box and better, which is certainly a record figure. The recent awarding of over a million shell boxes by the Imperial Munitions Board has caused considerable activity and will require some ten or twelve million feet of white pine, spruce and hemlock to execute the work.

The recent increase which has gone into effect in freight rates over the line will sooner or later be reflected in carrying charges in Canada, and it is rumored that the Canadian roads are already planning to make application for an elevation in the tariff. Everything portends stiffer lumber prices, and as time for starting logging operations draws near there is no visible sign that anything like the number of men who were secured last season will be available. The decreased cut this season and the restricted operations of next will have every tendency to boost present prices.

Building operations have taken a swing upwards and returns from the 36 largest cities in the Dominion show that the value of the permits exceeded \$5,000,000, a gain over May, 1917, of approximately \$1,500,000. Up to the end of May, comparing the five months of 1918 with those of 1917, a net increase of half a million is revealed. This is encouraging to the retail lumbermen, many of whom have for several weeks been marking time. There is little or no export business being done with the Old Country. A well known Toronto firm who wanted to ship maple roller blocks to England for the purpose of having them converted into mangles, was astonished when advised from New York that the rate, which before the war was 19c per hundred, had jumped to \$12.50. As a thousand feet weighs about 4,000 lbs., the total carrying charge per M would be \$500, which is practically prohibitive. The Toronto concern concluded that it would rather let the blocks remain on the docks of New York than pay any such money to have them sent overseas.

As the season progresses more men are available for the mills than was at first supposed would be forthcoming. The action of the government in enforcing the anti-loafing law has made many so-called wealthy foreigners get down to business, instead of playing "gentleman" part of the time. On the whole the situation is regarded as substantially strong and a better feeling exists throughout all branches of the trade than prevailed some weeks ago. Business from across the border is good.

In connection with the increase in U. S. freight rates the following bulletin was sent out by the Canadian Lumbermen's Association, and explains itself:

At midnight, June 24th, the increases authorized by Director General McAdoo on international rates takes effect. The board of Railway Commissioners for Canada has indicated that rates from Canadian points to the United States, will necessarily be increased correspondingly.

These advances are to be allowed to become effective on one day's notice.

The increase of the old rates made by the Canadian roads on international traffic to the extent of 15 per cent. (without any maximum) will become extinct midnight, June 24th.

After midnight of June 24th, the following will be the legal rates: Add to the old rates 15 per cent, but with a maximum of 1c per hundred lbs. Then add to this 25 per cent with a maximum of 5c per hundred lbs.

To illustrate:

Take an old rate of	11 cents
Add maximum of 1c. per 100 lbs.....	1 cent
	—
	12 cents
Add 25 per cent with a maximum of 5c per 100 lbs.	
25 per cent. of 12 cents equals.....	3 cents
	—
	15 cents

Take an old rate of	23 cents
Add maximum of	1 cent

	—
	24 cents
Add maximum of	5 cents
	—
	29 cents

If 25 per cent were added to 24c it would make such rate 30c, instead of 29c.

Great Britain.

Recent advices received from the Old Country are to the effect that the import of wood goods from Scandinavia is now in the hands of the government and licenses for fresh contracts are being refused. There have been no imports of Quebec board pine, square pine or red pine during the last three years, while the stock on hand at Manchester shows only 32,000 cubic feet. Another report of the month of May shows that during the present year there has been imported at Liverpool only 210 standards, of N. B. and N. S. spruce and pine, which is slightly more than was imported in 1917, and about one-eighth of what was imported in 1916. There has also been a decided falling off in consumption and stock. The stocks of spruce standards, in Manchester and Liverpool combined, are now 7,330, whereas in 1914 there was nearly double this number. There are only 120 loads of birch logs in Manchester and Liverpool as against 1,180 in 1914, and in birch planks there are only 84 standards at the two ports as against 940 in 1904. Imports, consumption and stocks have sadly fallen off in every line of imported wood since the outbreak of the war. Reviewing current conditions the "Timber Trades Journal" says the trade returned to work after the holidays in the hope of finding something to do; but, as far as foreign business is concerned, there has been no change except an increasing wonder as to when the new arrangements will be announced. Some are rather more hopeful about the future, assuming perhaps that no news is good news; but the majority are pessimistic and suspicious of any Government scheme bringing much relief or benefit to private trade. There is plenty of inquiry for all balances of imported wood in merchants' hands, and the top prices allowed can nearly always be obtained. The home-grown trade is, of course, absorbing more attention as the import business dies away, but the demand is greatly in excess of the present supplies with the labour available can produce, and merchants dare not take orders for very long in advance.

There is no break in the conditions that dominate the hardwood market. Activity in meeting Service requirements alone sustains the life of the trade, otherwise matters are dormant, and the gradual depletion or final exhaustion of all supplies, whether held in docks, at wharves, or in yarded quarters, points to an immediate future prospect in which a steady ebb in the vitality of the trade is to be contemplated. The outlook is not encouraging, however great the desire may be to envisage the prospects cheerily.

The softwood section of the trade has been for some time past in a state of expectancy in regard to the steps that are being taken respecting the entire control of the supplies of these woods. Although it was at one time anticipated by many in the trade that hardwoods would be included in this scheme, it is now the general idea that such a contingency is altogether remote.

The demand for home-grown stuff shows no sign of slackening, but the supply is still very meagre. The railway companies appear unable to cope with the traffic and only allow a very small proportion of stock to come forward.

United States

Lumber cut in the United States amounted to 35,831,239,000 feet in 1917, the Forest Service has announced. That was approximately ten per cent. less than in 1916. The general tone of business is good, and with the promising crop reports there is every indication that prices will be well maintained. So far no announcement has been made regarding the fixing of hardwood prices by the government, though it is generally recognized in the industry that such an announcement may come at any time. The manufacturers, in the meantime, are putting their house in order and preparing to show just what it costs to produce lumber. Should the price fixing policy be extended to cover hardwoods it seems probable that lists will be made up for the various softwoods first and then attention will be turned to the hardwoods. Thus it may be some weeks before anything definite is

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. BOLE, Pres. F. H. Goff, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

done. In some buying centers not a great deal of new business is being booked, in others bookings are brisk. The embargoes restraining shipments east are gradually being relieved and as the East is badly in need of hardwoods the gradual opening up of the district to commercial business will do much to nullify the seasonal dullness that appears in other markets. The demand for lumber for direct and indirect government needs continues and there is no indication of any slackening in the demand.

White pine manufacturers are urging customers to place orders at once in order that they may be shipped while the supply of cars remains adequate. The supply of cars in the North is good just now, but those who have been looking into the future are convinced that the outlook for this fall is anything but encouraging. The mills, broadly speaking, decline new business that is offered where it is stipulated that this business must be shipped prior to June 25, the reason being that the mills have on hand all the orders that can be attended to before that period. More government business is being handled by the mills than is realized by the general public.

The demand for hemlock is fully up to the volume of lumber that is offered for sale. Probably some retailers and wholesalers have delayed the placing of orders pending the outcome of the government price fixing program, for on the whole hemlock sales are made for immediate, pressing needs that must be satisfied at once. Just how soon the government authorities will get around to fixing the price for hemlock can not be stated, though it will be some days. What the basis will be is also something that cannot be predicted, but to judge from the Pennsylvania list it will be fairly satisfactory. Hemlock—dry, good hemlock—is certainly not any too plentiful, and despite the fact that this is the dull season it moves in volume fully equal to the new cut. Every effort is being made to get forward as

large a volume as possible before the certain car shortage shuts down.

Referring to the situation in spruce the "American Lumberman" says: Eastern spruce manufacturers, on the whole, continue to do a great deal of business with the government, and as long as the cost of production does not greatly increase the prices obtained are said to be satisfactory. Despite the nearness of the mills to the buyers, deliveries are hard to make, and so the ability to deliver is not infrequently the determining factor in settling the price question. This statement, of course, does not apply to government business. On the other hand, retail dealers are not buying more than they absolutely need. Prices remain firm. In Canada the demand for spruce has picked up, largely because of the call for this wood for the manufacture of shell boxes. The increased demand, together with the amount of lumber that is moving into the United States, puts the Canadian mills in a good position, especially as it is now certain that the summer cut will be smaller even than was expected.

Speaking of current market factors, the same paper says:—A most important point to remember is that the prices fixed by the government at present apply to the retailers, but not to the customers of the retailers. Retail lumbermen should bear in mind the fact that the handling of the case is a new departure in fixing prices. Previously, when prices have been fixed, they have applied to the ultimate consumer, and unless the retailer keeps on the job there is apt to be some misunderstanding on this point. There are numerous ways to meet the situation. One is to advertise liberally and acquaint the public with the true situation, and at the same time watch out and see that the local papers do not receive garbled accounts. Then, too, the retailer will find it more and more to his advantage to sell houses, or barns or grain bins, instead of just lumber at so much a thousand feet.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Reports Falling Off in Trade

A continued decline in the volume of business done, both foreign and domestic, was the principal factor asserting itself in the Ottawa lumber market during the closing period of June. Orders and enquiries, especially from the United States, showed a further falling off.

Despite the general decline, local prices remained firm or in some grades advanced. The market, while slow, did not weaken. No developments warranting a decline in price presented themselves. Higher operating costs, unfavorable water conditions, and the prospect of a reduced cut, were three factors pointed to as being likely to sustain present prices.

The outlook for midsummer business did not appear any too bright, unless the demand increases considerably. There are hopes held out that the domestic demand will strengthen. A greater volume of building, both governmental and private, will be undertaken this summer than for any year since the war began. Only two companies in the Ottawa district reported the previous demand keeping up.

The Ottawa market for stock suitable for shell box manufacture did not show particular activity, following the issuance of contracts for over one million shell boxes, recently let by the Imperial Munitions Board. Only one Ottawa woodworking plant received a contract. It was for 150,000 boxes. This plant manufactures its own wood for the boxes.

The demand for the higher grades of stock fell away. There is no surplus of it and the prices asked for it is not cutting any figure, according to manufacturers' reports. Manufacturers believe that a good summer's Canadian business will develop for the lower grades of marketable stock. The chief demand from the United States lately was for dead culls, mill culls, cull spruce, and No. 2 hemlock. The reason for this demand being in existence for Canadian stock in the United States is thought to be largely due to the inability of shippers in the Southern States to ship to points where army cantonments are being erected. There is very little of such stock on the Ottawa market and in price it ranges from \$35 to \$40 per M. f.o.b. mill. There was practically no dry stock of these grades. Lath and shingles remained slow. There was not much activity in the sash and door trade.

The labor situation with the sawmills did not show much change. Sawing operations were confined to the day shift only, indicating that the cut this year will not likely be as large as last. The log situation by the water routes did not show much change as compared with the early part of June. Just about enough logs to keep the

mills running are coming down. None of the mills have yet reported receiving logs in sufficient quantities to warrant their storage in "reserves" at the mills.

A belief appeared to exist that manufacturers were not overly anxious to dispose of their stocks until they get the price asked. The increase in the cost of logs for the last two years is making itself felt in the price of sawn lumber. The amount of this season's mill cut that has already been sold is not proportionately as large as last year.

Wholesalers mostly reported a slow trade, and stocks of the retailers did not show much activity.

Official information as to the dispositions of the shell box contracts were refused the "Canada Lumberman" by the Imperial Munitions Board. Even the total amount of the contracts was withheld. From another source it was heard the total was one million, one hundred and ninety thousand. So far as could be learned, it is reported that ten of the contracts, totalling 913,000, went to the following parties: Eureka Planter Co., Woodstock, Ont., 40,000; H. Labelle, 100,000; H. Chagnon and Co., Montreal, 100,000; Guelph Carriage Top Co., Guelph, Ont., 43,000; James Davidson Sons, Ottawa, 150,000; Lindsay Factories, Ltd., Toronto, 100,000; Georgian Bay Shook Mills Ltd., Midland, Ont., 100,000; J. R. Eaton and Sons, Orillia, Ont., 70,000; Canadian Wood Products Ltd., Toronto, 110,000; Lally Lacrosse Mfg. Co., Cornwall, Ont., 100,000.

The average price at which the contracts were let it is understood was around \$1.15. The work is to be started about July 15th and completed in October.

From information gathered the highest of the ten contracts above was let at a price of one dollar and seventeen cents per box, and the lowest at one dollar and twelve cents per box. The contracts called for the two round six in. box.

Montreal Business Fair with Values Firm

Market conditions in Montreal are, on the whole, satisfactory. Local business, it is true, is nothing to boast about, but against this must be set the good demand for the United States. Prices hold very firmly, and there are many wholesalers who believe that there will be a gradual increase during the remainder of the year. This is, of course, a matter of opinion, but all are agreed that there is little prospect of any lowering of values. All the same, firms are still inclined to adopt a cautious policy in the matter of buying, in view of the stiff prices demanded by the manufacturers.

The pulpwood market is not as strong as it was, prices being down about \$1.50 per cord. Large quantities of wood are being ship-

Give the men better food at less cost

Do not leave out of the Camp food the many appetizing and nourishing dishes that require milk just because your camp is far removed from civilization and cows. Klim will solve your milk problem as it has solved scores of others. It makes puddings, soups, etc., that the men will relish and that supply the needed body-building elements of milk.

KLIM is pasteurized separated milk in powder form. It's genuine — the flavor proves it.

KLIM is ideal for use in lumber camps because it can be shipped or carried anywhere. It is light in weight, bulks small, requires no refrigeration and will keep sweet and fresh indefinitely. It is the most economical form in which milk can be bought—it costs less and entails absolutely no waste. Use what is needed from tin, replace cover, and remainder will be perfectly fresh when next required.

KLIM comes in handy 10 lb. tins which you can order with your grocery supplies.

ped out to the United States, the improved car service enabling more expeditious delivery to be made.

It is understood that the Imperial Munitions Board has changed its policy in regard to the construction of wooden ships. It was authoritatively announced that no more orders for wooden vessels would be given out, but it is now stated that the Board is making inquiries from builders as to further boats. This will mean further business for British Columbia, where prices are now a little higher.

In conversation with provincial manufacturers, emphasis was laid on the serious increase in the cost of labor and material, which has compelled the high quotations for the new cut. The manufacturers also pointed to the labor shortage and to the lack of efficient help, this making for enhanced cost. In this connection the Provincial Government has ordered that, on account of the scarcity of labor in the factories engaged in the manufacturing of military supplies and munitions, and consequent upon a great number of young men having been called to the colors, the provisions of the regulations in certain industries be modified, permitting girls and adult women to form part of night shifts. This will allow of the employment of girls over 18 years of age on night shifts, providing that the night shift shall not be for more than eight consecutive hours.

Deals for the United Kingdom are still being sent in small quantities. Lumber is also being loaded here and at Three Rivers for South Africa. In the St. Maurice Valley mills which formerly manufactured for Europe are now cutting largely for the United States, there being a considerable amount of lumber cut in 1917 for overseas still in the yards.

St. John Complains of Many Embargoes

The car order business for United States points is not as good as two weeks ago. Prices have not weakened to any extent, but orders are very scarce, and just at the moment embargoes are on in many yards and sidings, being lifted a few days at a time and only nicely open when the railways again put up another hold up and the shipper, if he has any orders at all, is worrying as to how long he will have to fill them before he has an embargo placed against him.

During the past few days market quotations cut no figure, as very few buyers are to be found. What few there are in some cases have very far apart ideas of values. If they have a customer who wants goods the price makes very little difference.

The English market is forgotten. No lumber is being forwarded either by the government or the deal merchants, therefore price does not figure at all, as there is no market. Not a sale of any consequence has taken place at St. John and the mills are piling up their cut of lumber very fast. Unless an opening is made before long some will have to shut down.

Factory work at St. John is very good. Prices for this work are gradually increasing and will do so as long as labor and raw material keep climbing. Practically all jobs being carried out here is of a repair nature. No large buildings and very few houses are being erected. No doubt repair work will be steady as buildings are always depreciating and must be kept up. Low grade stocks are in good demand and no great stocks of culls are on hand at the mills.

The St. John River Log Driving Company are doing very good work, both on the driving in the main river and also in their rafting operations, having at the present time about a normal crew at work.

Proposal to Log Big Timber Limits

Seven hundred million feet of fir and cedar timber lying to the north of Port Haney will be opened by Messrs. Abernethy & Loughheed, local representatives of the Miami Corporation, of Wilmington,

Delaware, providing the municipal voters of Maple Ridge vote in favor of a plebiscite to be taken shortly.

The area to be logged is known as Limit W and to bring the logs to the Fraser River a railway fifteen miles long is an essential. At a recent meeting of the council Mr. N. S. Loughheed placed a concrete proposition before the municipal fathers and went thoroughly into the details of the scheme before preferring a request for permission to cross certain roads in the municipality with the proposed railway.

Mr. Loughheed later amplified his statement to the board when he told of quietly conducting negotiations, extending over the past three months, by which the company had purchased land through the municipality for a right of way. Last week saw these efforts practically completed when a substantial section of foreshore was obtained along the Fraser River in the vicinity of Kanaka Creek.

"There is enough timber in these limits," said Mr. Loughheed, "to give a continuous supply to the mills at Haney, Hammond and New Westminster for the next fifteen years.

"It will cost the company at least \$250,000 to build the road and means a steady crew of several hundred men, all of whom will receive high wages. Not only will the project mean much to the lumbermen of the Coast, it has immense possibilities as an asset to the municipality itself, providing as it will, an all year market for farm produce of all kinds, through the local merchant as well as the individual producer."

It is learned that the Miami Corporation directly represents the heirs of the late millionaire, James Deering, of the Deering Harvester Company. The company is licensed to operate in British Columbia and it is likely that when actual development begins, that Abernethy and Loughheed will be their British Columbia agents.

Toronto Lumberman Passes Away Suddenly

The death of Wm. J. Hetherington, who died very suddenly at his home in Toronto on June 16th, caused a shock to his many friends in the trade with which he had been associated all his life. Mr. Hetherington had not been in good health for some time, but was able to attend to his duties as manager of the Wm. Laking Lumber Company and the Riverdale Lumber Company. He was also present at the regular monthly meeting of the Wholesale Lumber Dealers' Association, which was held at the Queen's Hotel on June 14th. He took an active part in the discussion and was in bright spirits, although toward the end of the evening he complained to a friend sitting next to him that he had a pain in the region of his heart. Only a few days before Mr. Hetherington, who was on the board of directors of the National Hardwood Lumber Association and was completing the second year of his second term, had called a gathering of the members in Toronto over which he presided. He always took a deep concern in the welfare of lumber organizations and the trade generally, and had resided all his life in Toronto. Of a genial, kindly disposition, he was well thought of and highly regarded by every branch of the industry. Mr. Hetherington was a member of Zetland Lodge, A. F. & A. M., and other organizations. He is survived by an aged mother, a wife and six children. There are five daughters and one son, the latter being a member of the artillery at Petawawa Camp. The funeral, which took place on June 18th, was largely attended by representative lumbermen who mourned the loss of one whom they had learned to esteem through many years of business and social intercourse. The floral tokens were beautiful. A huge wreath was sent by the National Hardwood Lumber Association of Chicago, at the annual gathering of which it was the intention of Mr. Hetherington to be present. Just as he was concluding arrangements for the Toronto party to depart on the following Monday death interfered and cast a gloom over the delegates, some of whom proceeded to Chicago immediately after attending the last sad rites.

Not just chains, but chains that combine all the qualities and features demanded where greatest production or capacity is to be obtained.

Our 36 years of Chain building experience and knowledge of the Lumber Industry's needs makes the recommendations of Jeffrey Engineers valuable to you.

We ask the opportunity to prove our claims to you. Write for Catalog.

The Jeffrey Mfg. Co.

Canadian Branch and Warerooms
MONTREAL

S-1 1/2
Long Spur

K-5 Attachment

Long Link Coil Chain

For Log Hauls with S-1 1/2 Spurs
For Heavy or Light Refuse and Slab Conveyers, use U Bolt or K-5 Attachments to carry flights or scrapers.

License Holders Protest Against Fees

Say That B. C. Government Demands are Out of All Reason and Will Prove Disastrous if Enforced

Claiming that if the government did not grant relief in an extension of time for the payment of the licences on their holdings, or assistance of some kind, that hundreds of them would have to abandon berths which they had been carrying for years, and on which they had paid out thousands of dollars, a large deputation of lumbermen met Hon. T. D. Pattullo, Minister of Lands, at his office in Victoria recently, and made a strong plea for relief.

The situation was thoroughly gone into and the difficulties under which the lumbermen are labouring fully set forth.

It was pointed out that, in the opinion of the lumbermen at least, the trouble largely arose out of the conditions caused by the war, and the impossibility, because of those conditions, of the lumbermen disposing of their holdings.

Just previous to the going out of power of the old government, legislation was passed extending the time for payment of the licences on these berths until a period of six months after the war. The result of this, the new government claimed, was that large numbers of these holders simply quit paying their licences and a large amount of revenue the government should have been receiving they simply had to carry, and in order to, as they hoped, get that revenue coming in again they, at the last session, annulled that legislation.

The extension period provided for in the new legislation expires on July 1, and large numbers of the holders, it was stated, found it simply impossible to take up their obligations.

A. F. Sutherland, a prominent timber broker, presided at the meeting, and in a brief address laid the matter before the minister. He said that he knew of one man in the room who had been carrying a large block of timber for many years, and had actually paid out over \$165,000 in timber licence fees to the government. A great deal of this money had been borrowed from the banks on his own personal property. The banks would not take the timber as security. The licences, in spite of the large amount paid out, were still in arrears, and this dealer could not pay, and if the announced policy of the government was carried out, the licences would be cancelled and all that money would have been paid in vain, and the property he had pledged as security would be lost.

"You may say that this is a matter of speculation," said the speaker, "and that this man is carrying more than he should be, and that is true to a certain degree, but in this case at least, and in many others, the man had no control over the situation. He would have sold if he could have done so. He can get no further advances on his private property now and can pay no more."

In replying, Hon. T. D. Pattullo said he was glad to meet the timber men and to listen to their presentation of the case. The question was one which had given the government very serious difficulty. When they came into office they found that dues on timber licences had been pyramiding to a really alarming extent, and the revenues from that source was suffering very much.

Large numbers of the licences were held on the other side. Men there had taken advantage of the action of the government to cut out their payments altogether, though previous to that they had been paying with a fair degree of regularity. This was also true to quite an extent with eastern holders. They were making big profits in war contracts, but were simply making the British Columbia government wait. They wanted to use their money in enterprises in which they could see immediate profits. It was to meet that situation the government had passed the legislation complained of. He was firmly convinced in a general sense it was in a way only the individual who was affected by it and that it was not proving a general hardship. He believed that this was so because numbers who had not been paying did so as soon as the government took the attitude that they must do so. He had every sympathy with the harassed individual and believed he ought to be protected.

He did not agree with the suggestion of some of the speakers that the legislation could be called repudiation. It could not be said that if the government found improper legislation on the statutes that they must allow it to remain. The people must be protected. The government had inherited a dozen or so problems which had given them a great deal of trouble. He was, he said, blaming no one for them, but they had nevertheless, to be met, and they were doing their best to solve them. A committee of lumbermen will confer with the government.

Will Erect New Mill in B. C.

It is understood that Maurice M. Wall, of the Buffalo Hardwood Lumber Company of Buffalo, N.Y., and associates, who own several tracts of timber in the Thompson River Country of British Columbia, are arranging for its being cut. This is said to include

several exceptionally good lots of timber which were carefully selected and purchased a number of years ago with a view of incorporating them in a lumber company, with a mill at a central point, when conditions would justify marketing their product. The owners now seem to feel such time has arrived and are reported to contemplate the erection of quite a large mill which will be operated by prominent American mill owners who will join in the enterprise.

Not Much Wood will be Peeled

The outlook for a large supply of pulp wood in the Maritime Provinces is not bright. The scarcity of labor and the high rate of wages are effecting the situation. Contracts are usually made with the producer for a certain number of cords. If the fails to deliver, or come up to contracted quantities, he is liable to trouble.

Wages have increased even over last year's per diem standard for peelers. The price on fir and spruce wood, according to one well-known purchaser, will not be advanced. It is more likely that the price will drop on this quality of wood. He said the yards at the big mills were loaded to capacity (these yards usually carry a two years' stock) and there is no particular desire to wrap up more money in wood because of uncertainties in the market.

The situation gives rise to uncertainties in that government regulations may, eventually, standardize the price of wood, as well as the output of mills, and the purchasers do not care to take the gambler's chance, on present prices, as it is believed, should the standard price for wood be established by government regulations, it would be lower than now prevails.
